GPU Graphics Pipeline (Part I)

Computer Graphics

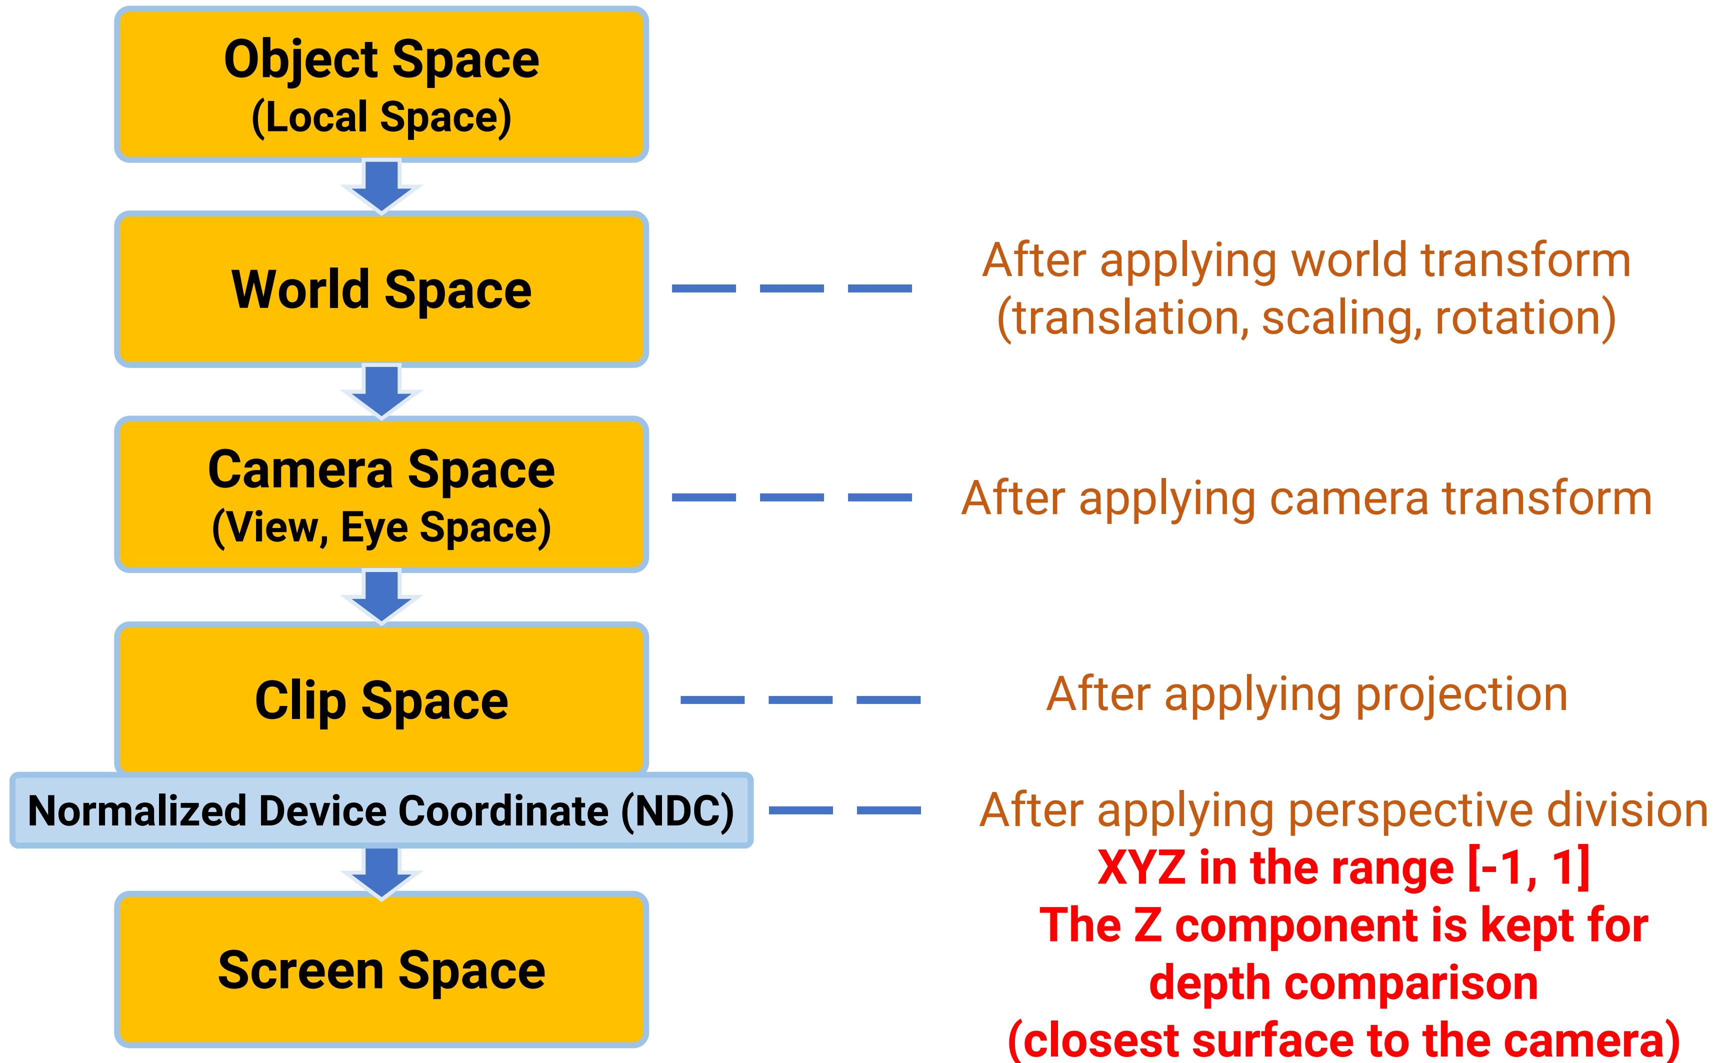
Yu-Ting Wu

Outline

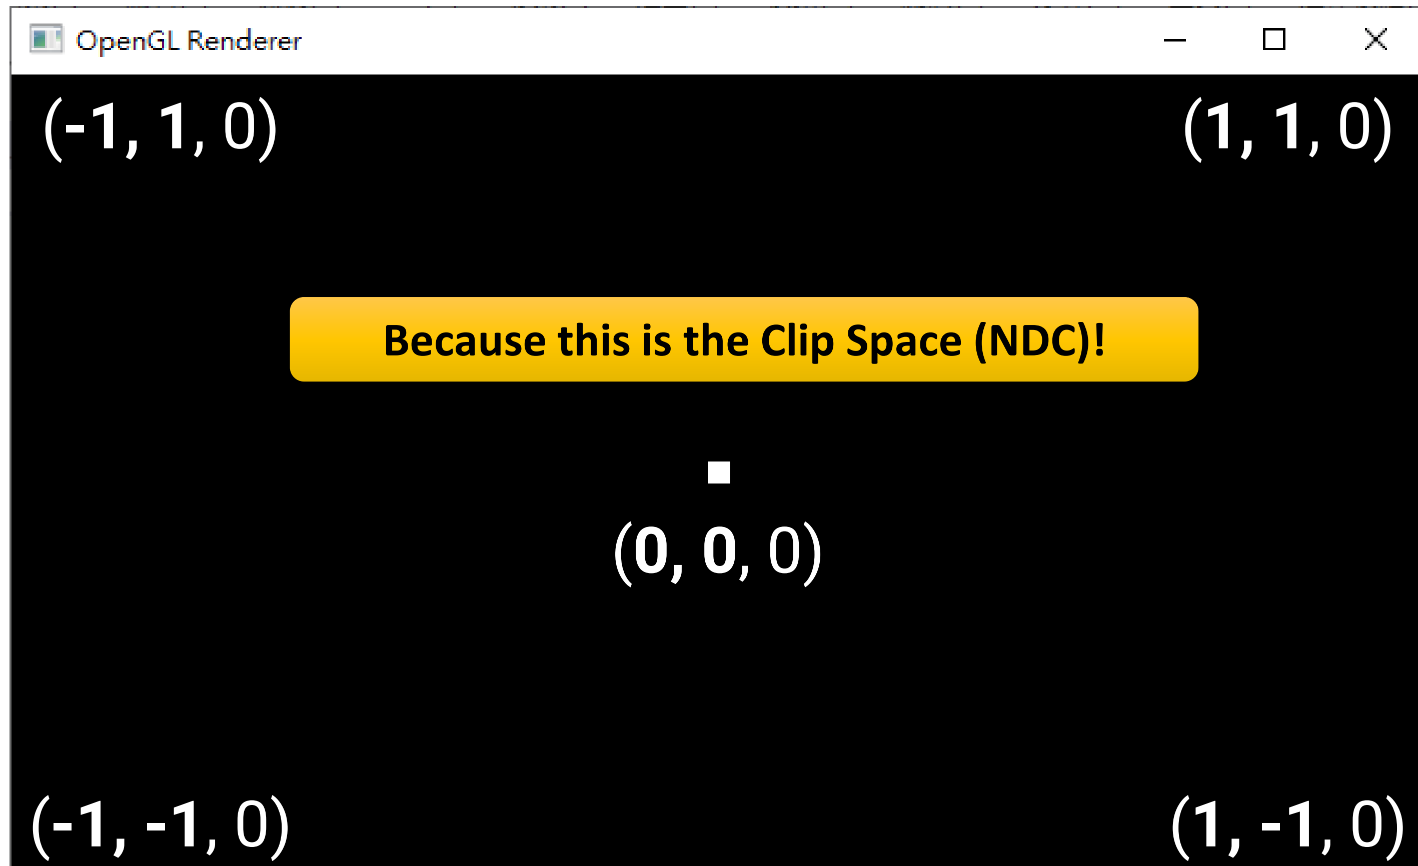
- GPU graphics pipeline
- OpenGL graphics pipeline 1.x (Part I)
- OpenGL graphics pipeline 2.0

- OpenGL and shader implementation (Part II)

Recap.

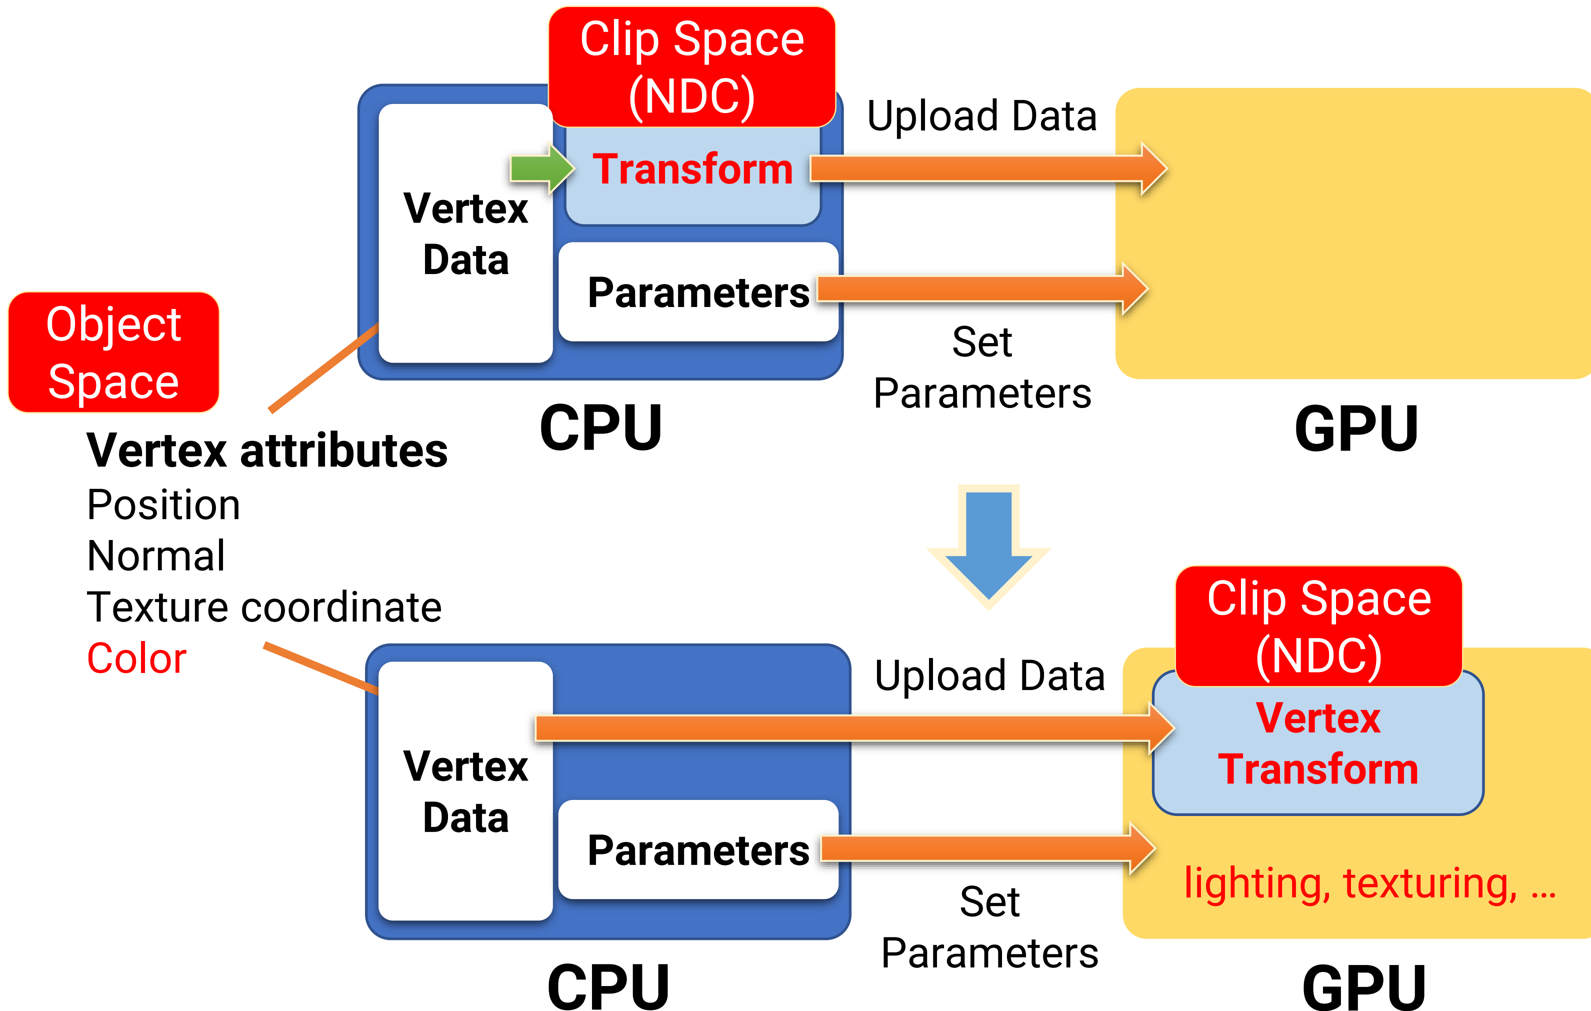


Recap. (cont.)



What about the *z* coordinate? You can find the point will only be visible if its *z* value is within **[-1, 1]**

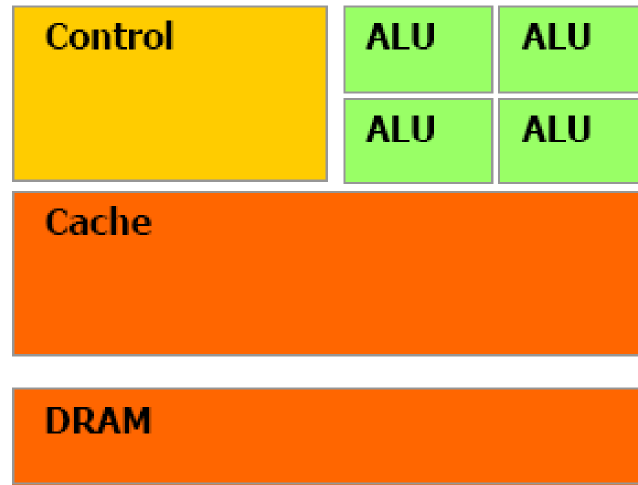
Recap. (cont.)



Outline

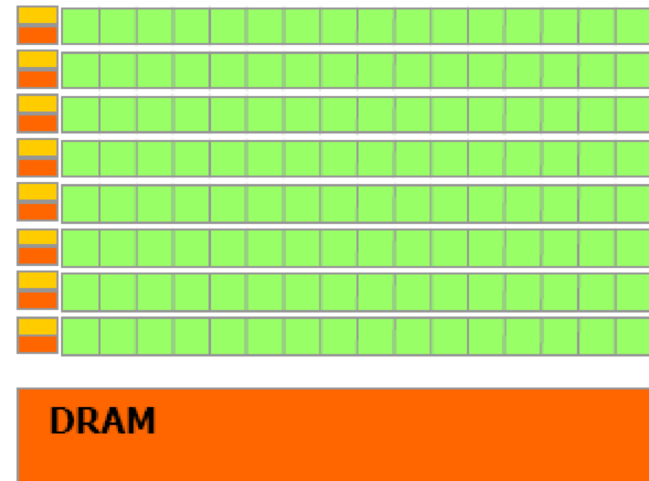
- **GPU graphics pipeline**
- OpenGL graphics pipeline 1.x
- OpenGL graphics pipeline 2.0
- OpenGL and shader implementation

CPU v.s. GPU



Good at

- Serial processing
- Control (branching)
- Larger cache



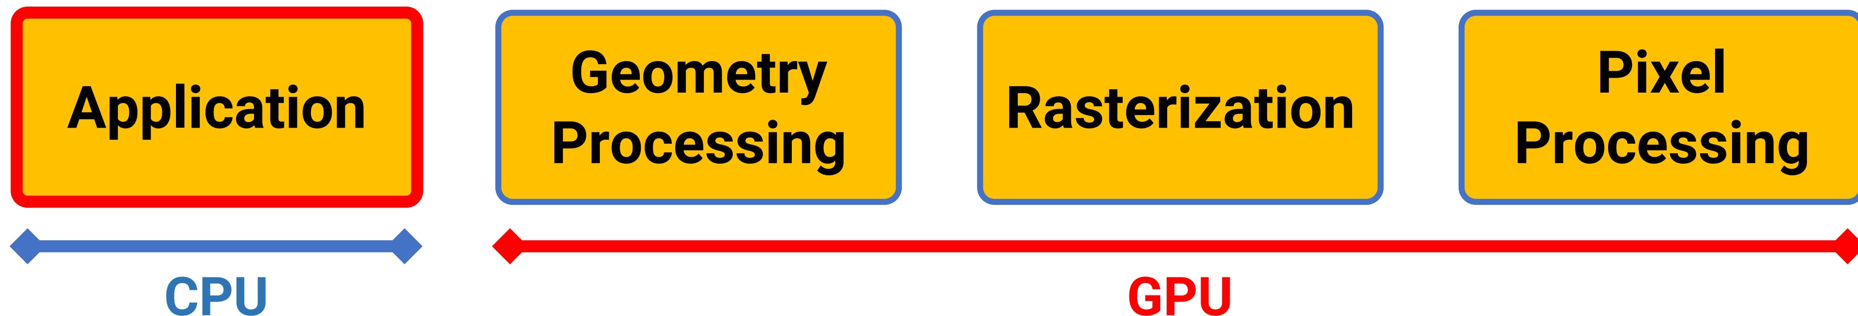
Good at

- Parallel processing
- SIMD
- Higher throughput

Pipeline

GPU Graphics Pipeline Overview

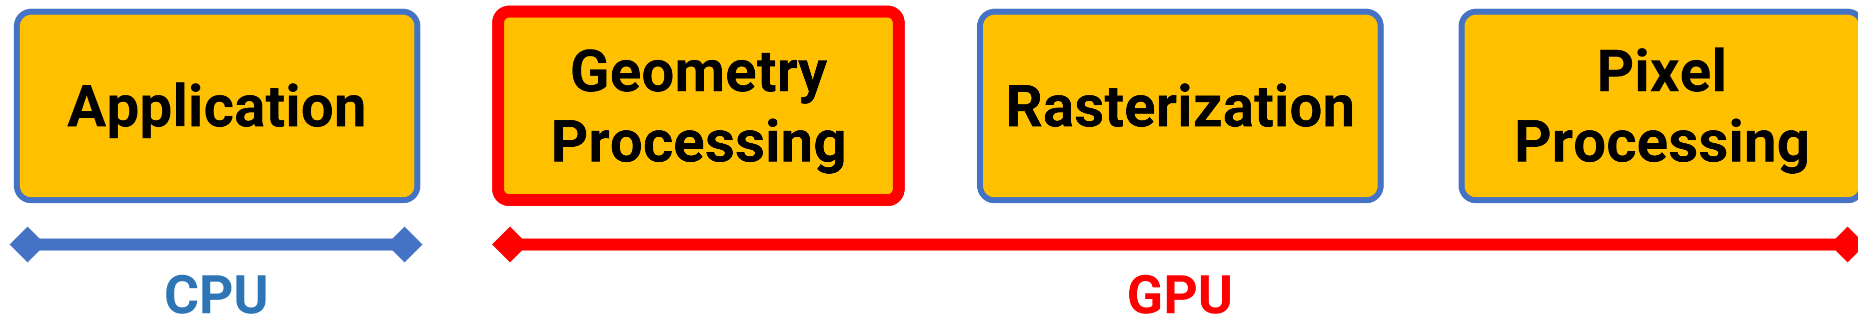
- Responsible for the fixed routines of bringing triangles to pixels
- Can be roughly categorized into 3 stages



- Physical simulation
- Animation
- Collision detection
- Global acceleration
- etc.

GPU Graphics Pipeline Overview (cont.)

- Responsible for the fixed routines of bringing triangles to pixels
- Can be roughly categorized into 3 stages

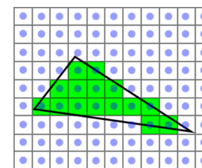


- Vertex transform and projection
- Vertex lighting and shading (rarely used now)
- Geometry assembly
- Clipping
- Culling

GPU Graphics Pipeline Overview (cont.)

- Responsible for the fixed routines of bringing triangles to pixels
- Can be roughly categorized into 3 stages

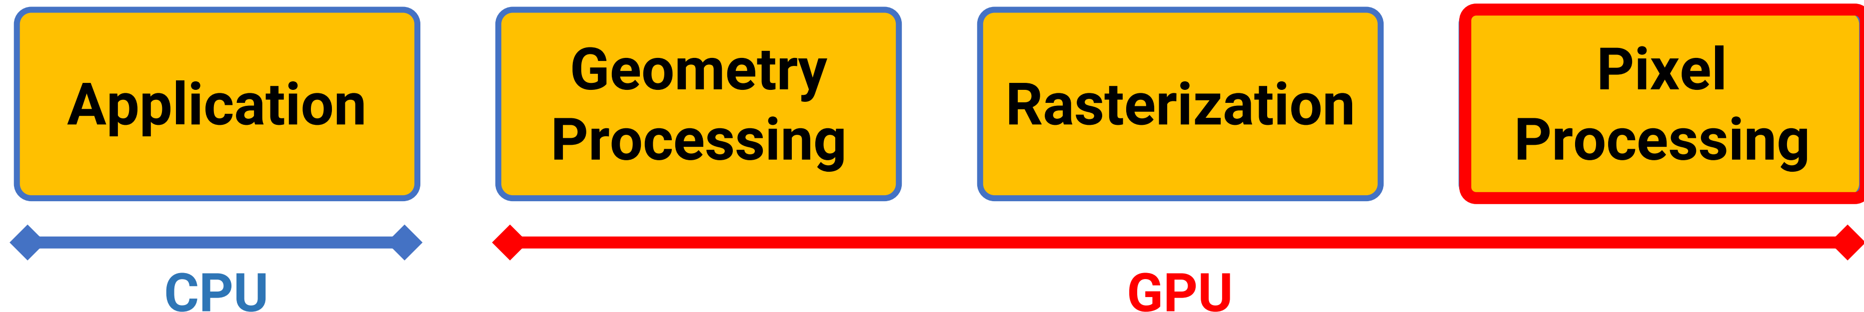
- Triangle setup
- Fragments (pixels) generation
  - Attribute interpolation



from continuous to discrete

GPU Graphics Pipeline Overview (cont.)

- Responsible for the fixed routines of bringing triangles to pixels
- Can be roughly categorized into 3 stages



- Pixel shading / Texturing
- Depth testing
- Alpha blending

GPU Graphics Pipeline Overview (cont.)

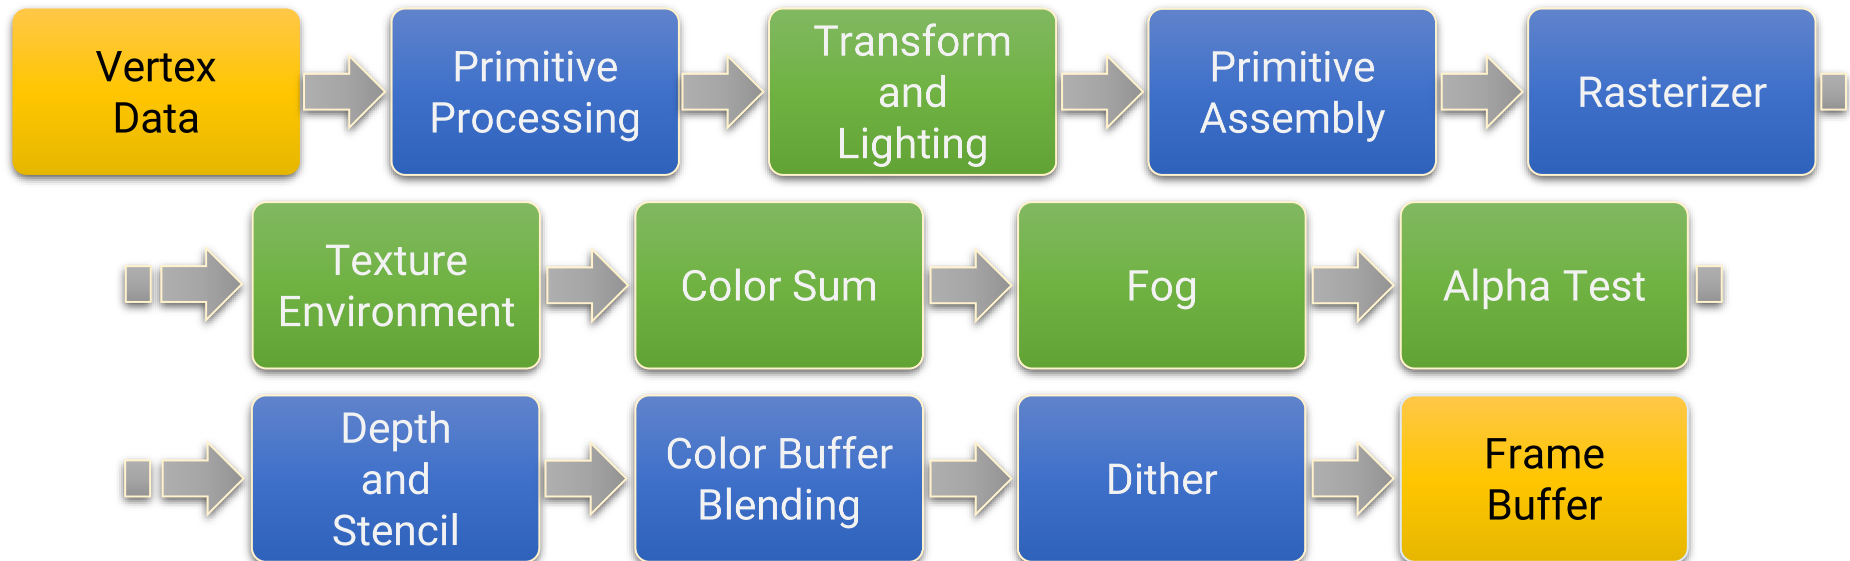
- In the slides, we will first introduce the GPU rendering pipeline revealed in **OpenGL 1.x**
- After that, we will show why (and how) some stages become **programmable** in **OpenGL 2.0**

Outline

- GPU graphics pipeline
- **OpenGL graphics pipeline 1.x**
- OpenGL graphics pipeline 2.0
- OpenGL and shader implementation

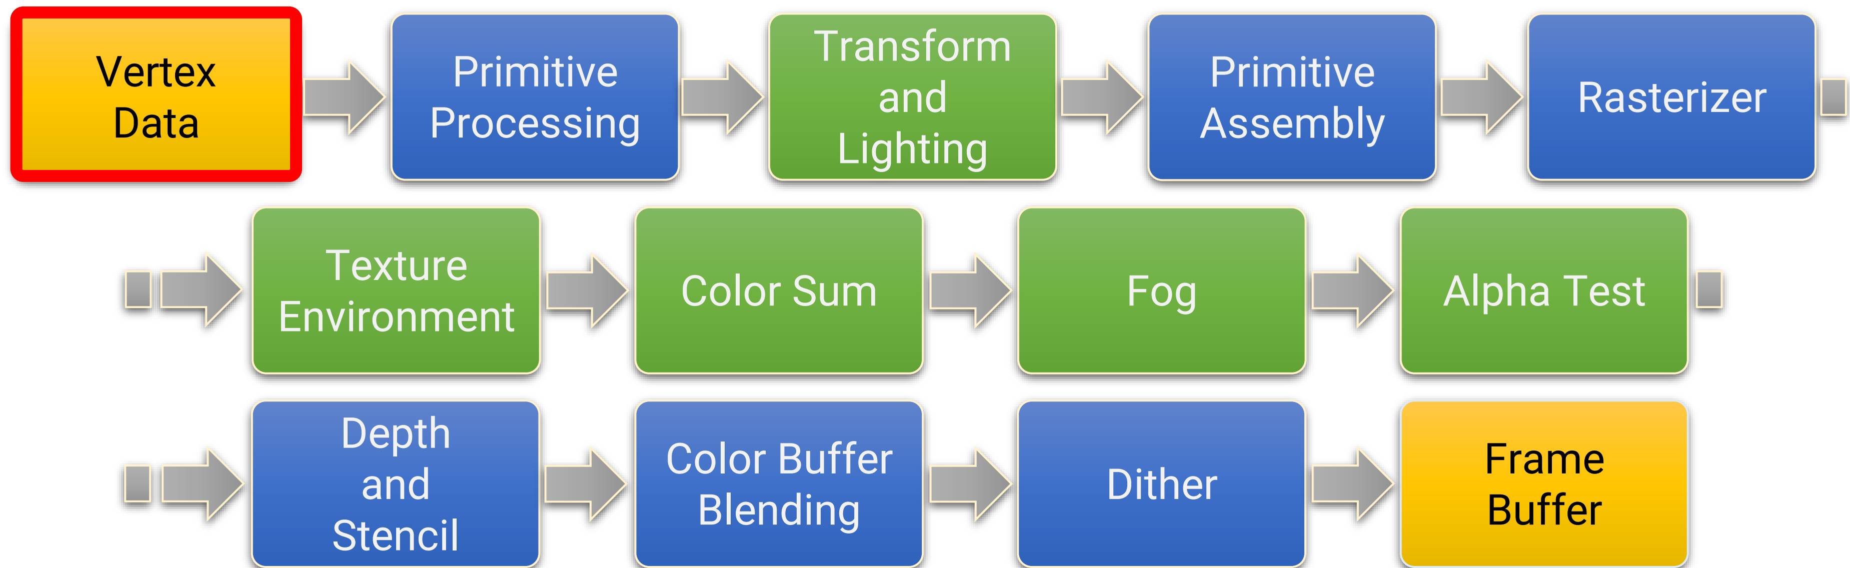
OpenGL (1.x) Fixed Function Pipeline

- Used when OpenGL was first introduced
- All the functions performed by OpenGL are **fixed** and **could not** be modified except through the manipulation of the **rendering states**



- The stages shown in green have been replaced by **shaders**

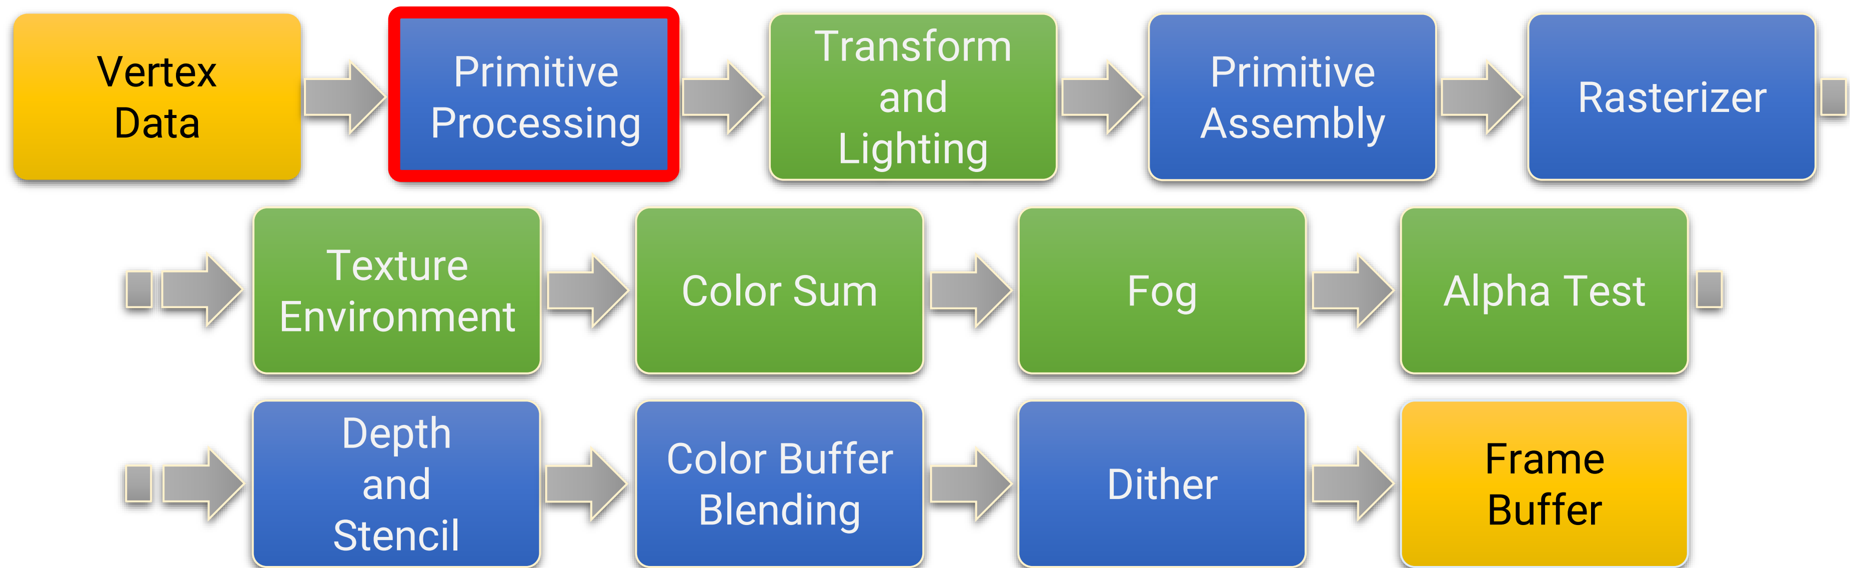
OpenGL (1.x) Fixed Function Pipeline



Vertex Data

- Send the vertex data to the GPU
- **Vertex attributes** include vertex position, vertex normal, texture coordinate, vertex color, fog coordinate, etc.
- The vertex data processed by the GPU is referred to as the **vertex stream**

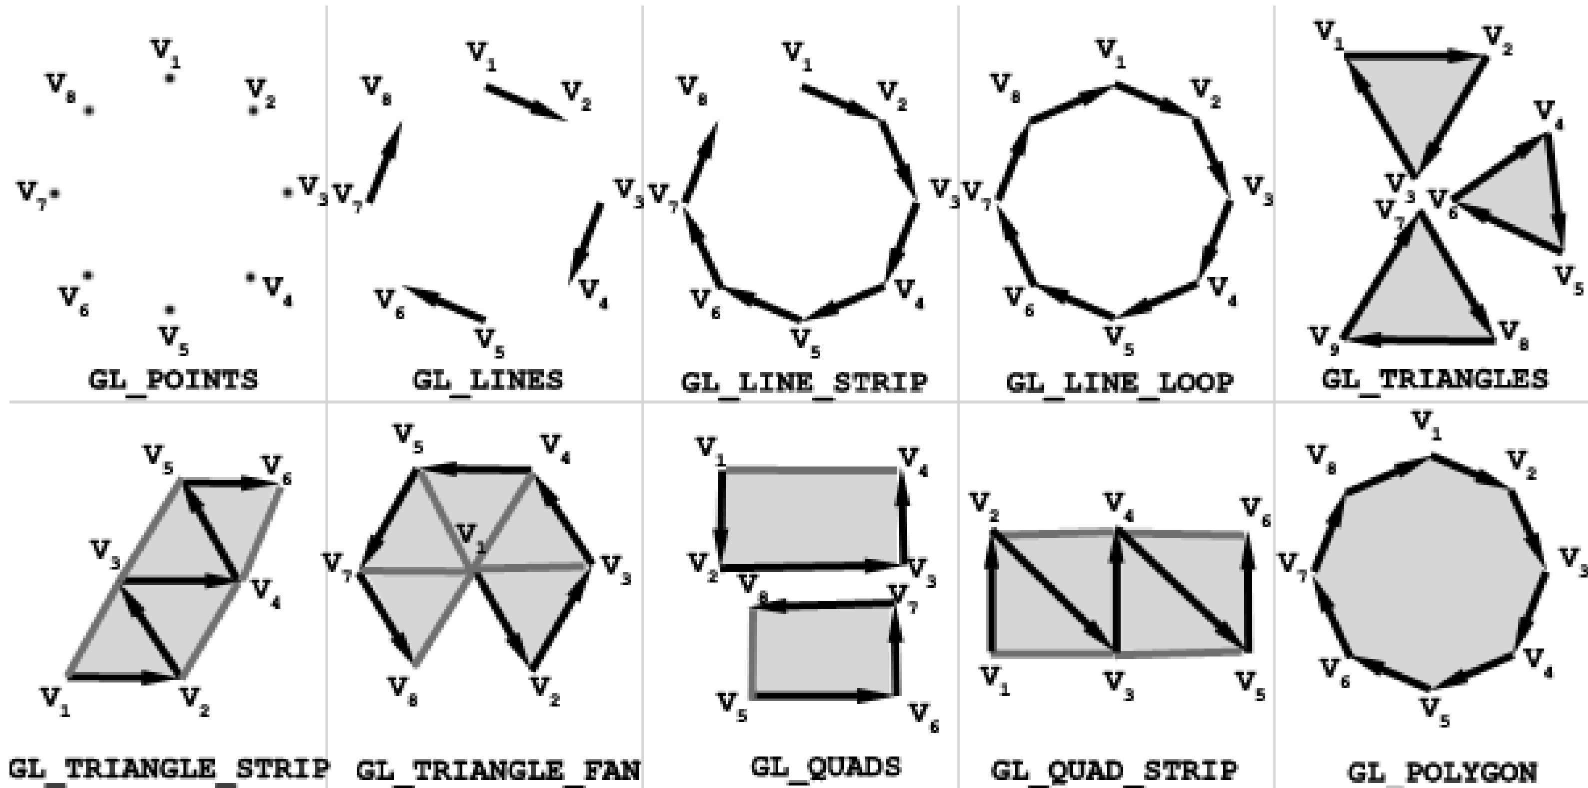
OpenGL (1.x) Fixed Function Pipeline



Primitive Processing

- Vertex stream is processed **per primitive**
- OpenGL supports several types of primitives, including points, lines, triangles, ~~quads~~, and ~~polygons~~ (**deprecated** after OpenGL 3.1)

Primitive Processing (cont.)



primitive types in OpenGL 1.1

Primitive Processing (cont.)

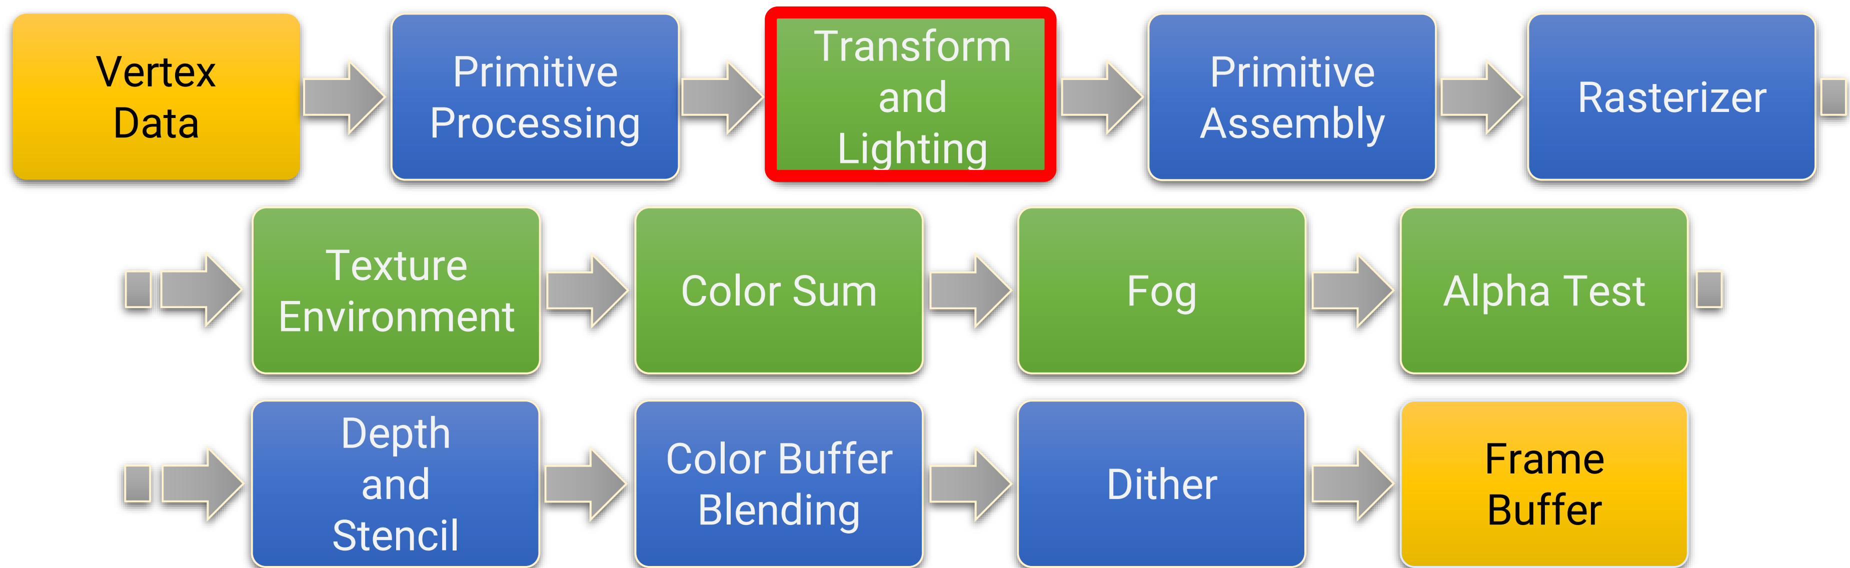
```
glBegin(GL_POINTS); //starts drawing of points
  glVertex3f(1.0f,1.0f,0.0f);//upper-right corner
  glVertex3f(-1.0f,-1.0f,0.0f);//lower-left corner
glEnd();//end drawing of points
```

```
glBegin(GL_TRIANGLES);//start drawing triangles
  glVertex3f(-1.0f,-0.25f,0.0f);//triangle one first vertex
  glVertex3f(-0.5f,-0.25f,0.0f);//triangle one second vertex
  glVertex3f(-0.75f,0.25f,0.0f);//triangle one third vertex
  //drawing a new triangle
  glVertex3f(0.5f,-0.25f,0.0f);//triangle two first vertex
  glVertex3f(1.0f,-0.25f,0.0f);//triangle two second vertex
  glVertex3f(0.75f,0.25f,0.0f);//triangle two third vertex
glEnd();//end drawing of triangles
```

```
glBegin(GL_POLYGON);//begin drawing of polygon
  glVertex3f(-0.5f,0.5f,0.0f);//first vertex
  glVertex3f(0.5f,0.5f,0.0f);//second vertex
  glVertex3f(1.0f,0.0f,0.0f);//third vertex
  glVertex3f(0.5f,-0.5f,0.0f);//fourth vertex
  glVertex3f(-0.5f,-0.5f,0.0f);//fifth vertex
  glVertex3f(-1.0f,0.0f,0.0f);//sixth vertex
glEnd();//end drawing of polygon
```

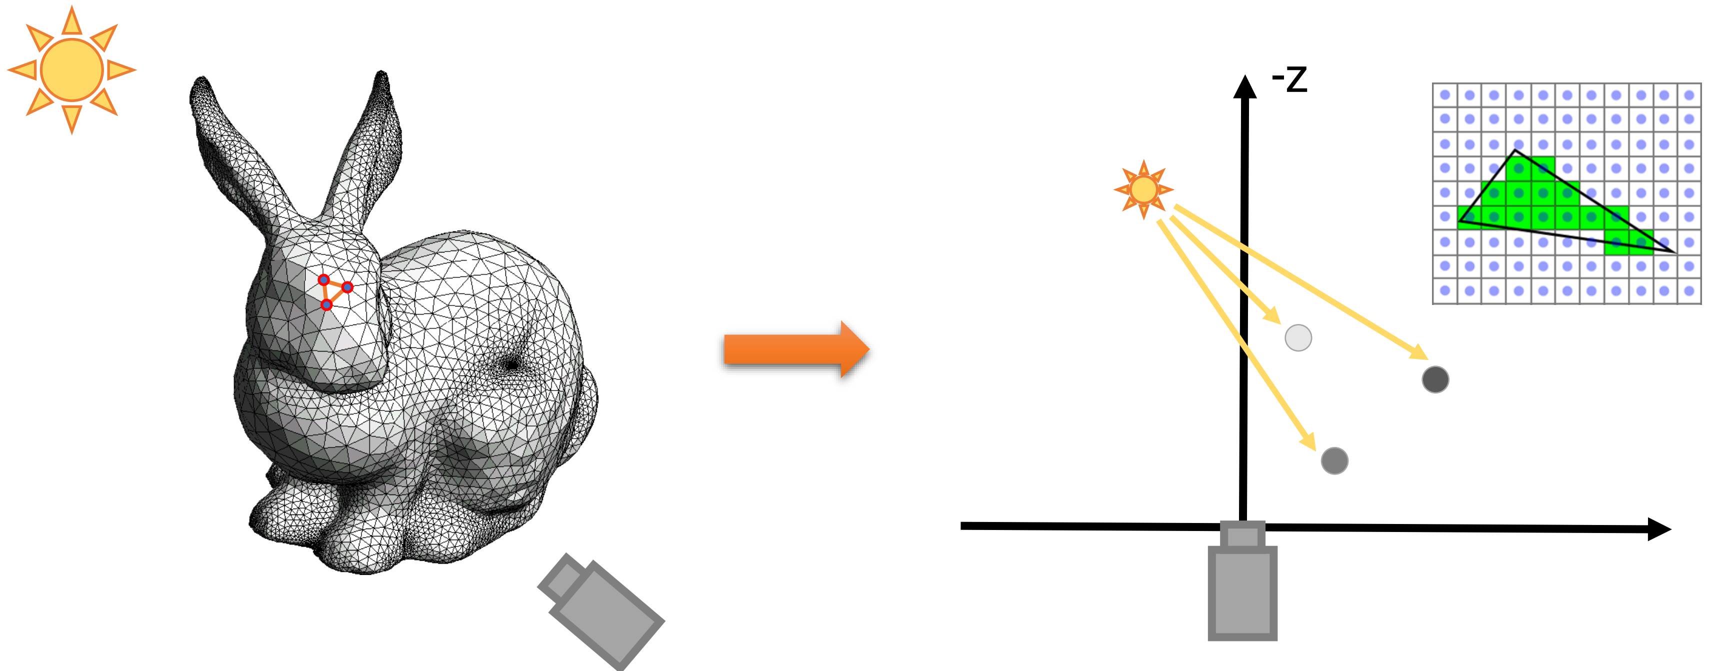
primitive drawing in OpenGL 1.1
(deprecated, DO NOT USE!)

OpenGL (1.x) Fixed Function Pipeline



Transform and Lighting

- Vertex is transformed to camera space by the current **ModelView** matrix
- Lighting is computed at each vertex (Gouraud shading)



Transform and Lighting (cont.)

- **Transform in OpenGL 1.x** **(deprecated, DO NOT USE!)**

```
void display(void)
{
   glClear (GL_COLOR_BUFFER_BIT);
   glColor3f (1.0, 1.0, 1.0);
   glLoadIdentity ();             /* clear the matrix */
           /* viewing transformation  */
   gluLookAt (0.0, 0.0, 5.0, 0.0, 0.0, 0.0, 0.0, 1.0, 0.0);
   glScalef (1.0, 2.0, 1.0);      /* modeling transformation */
   glutWireCube (1.0);
   glFlush ();
}

void reshape (int w, int h)
{
   glViewport (0, 0, (GLsizei) w, (GLsizei) h);
   glMatrixMode (GL_PROJECTION);
   glLoadIdentity ();
   glFrustum (-1.0, 1.0, -1.0, 1.0, 1.5, 20.0);
   glMatrixMode (GL_MODELVIEW);
}
```

Transform and Lighting (cont.)

- **Lighting in OpenGL 1.x** **(deprecated, DO NOT USE!)**

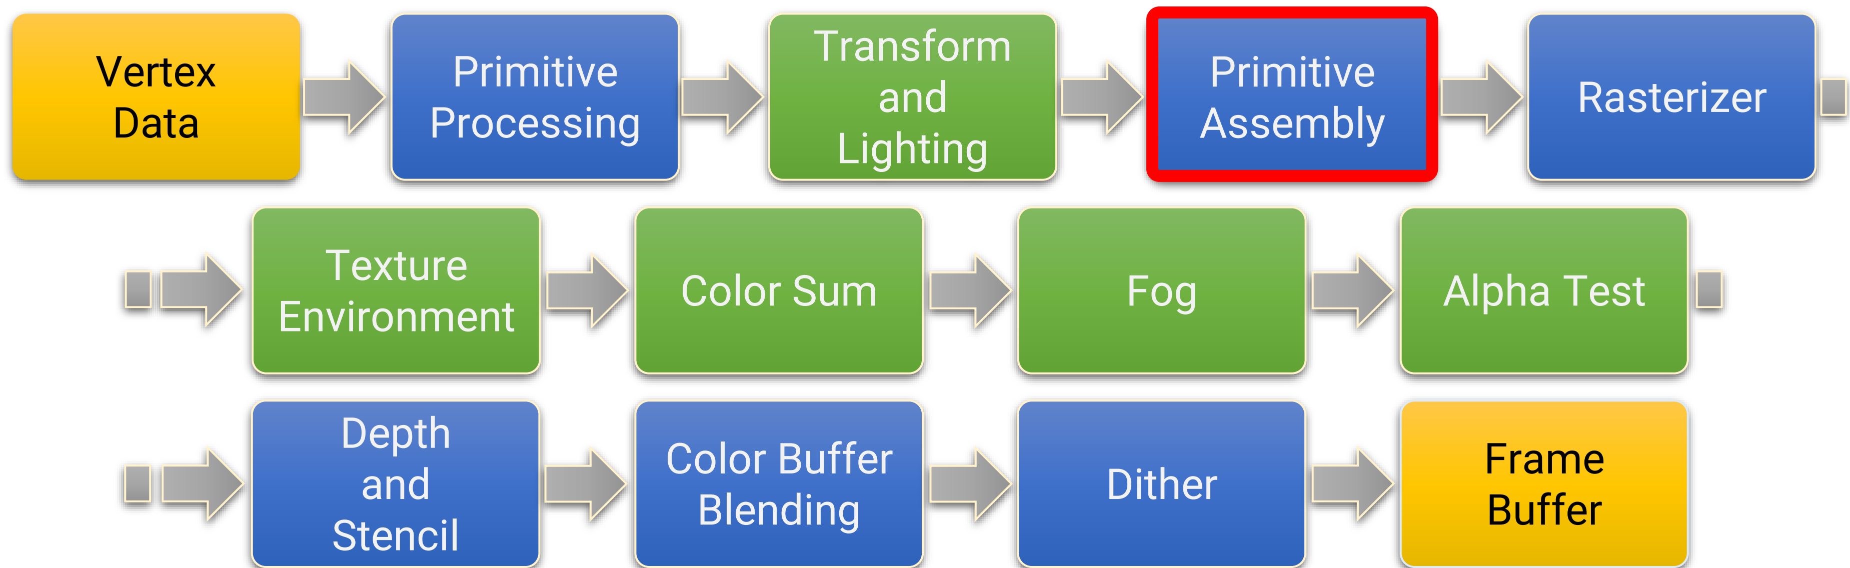
```
void init(void)
{
   GLfloat mat_specular[] = { 1.0, 1.0, 1.0, 1.0 };
   GLfloat mat_shininess[] = { 50.0 };
   GLfloat light_position[] = { 1.0, 1.0, 1.0, 0.0 };
   glClearColor (0.0, 0.0, 0.0, 0.0);
   glShadeModel (GL_SMOOTH);

   glMaterialfv(GL_FRONT, GL_SPECULAR, mat_specular);
   glMaterialfv(GL_FRONT, GL_SHININESS, mat_shininess);
   glLightfv(GL_LIGHT0, GL_POSITION, light_position);

   glEnable(GL_LIGHTING);
   glEnable(GL_LIGHT0);
   glEnable(GL_DEPTH_TEST);
}
```

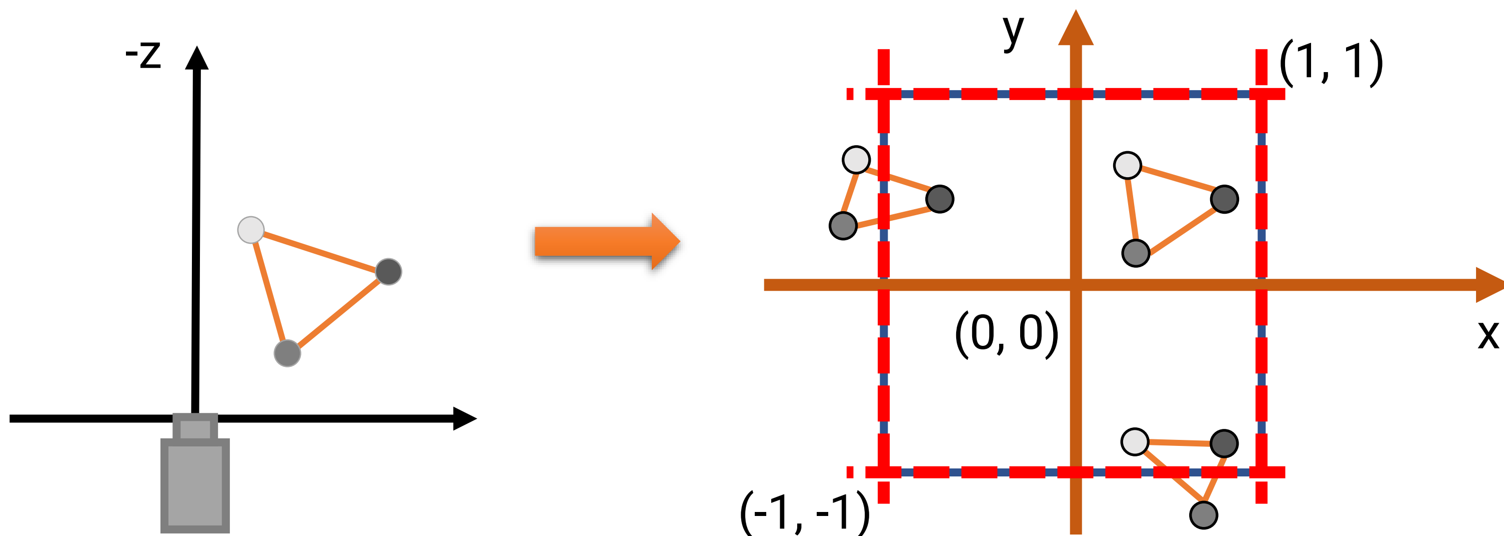
Support at most 8 lights:
GL_LIGHT0 to GL_LIGHT7

OpenGL (1.x) Fixed Function Pipeline



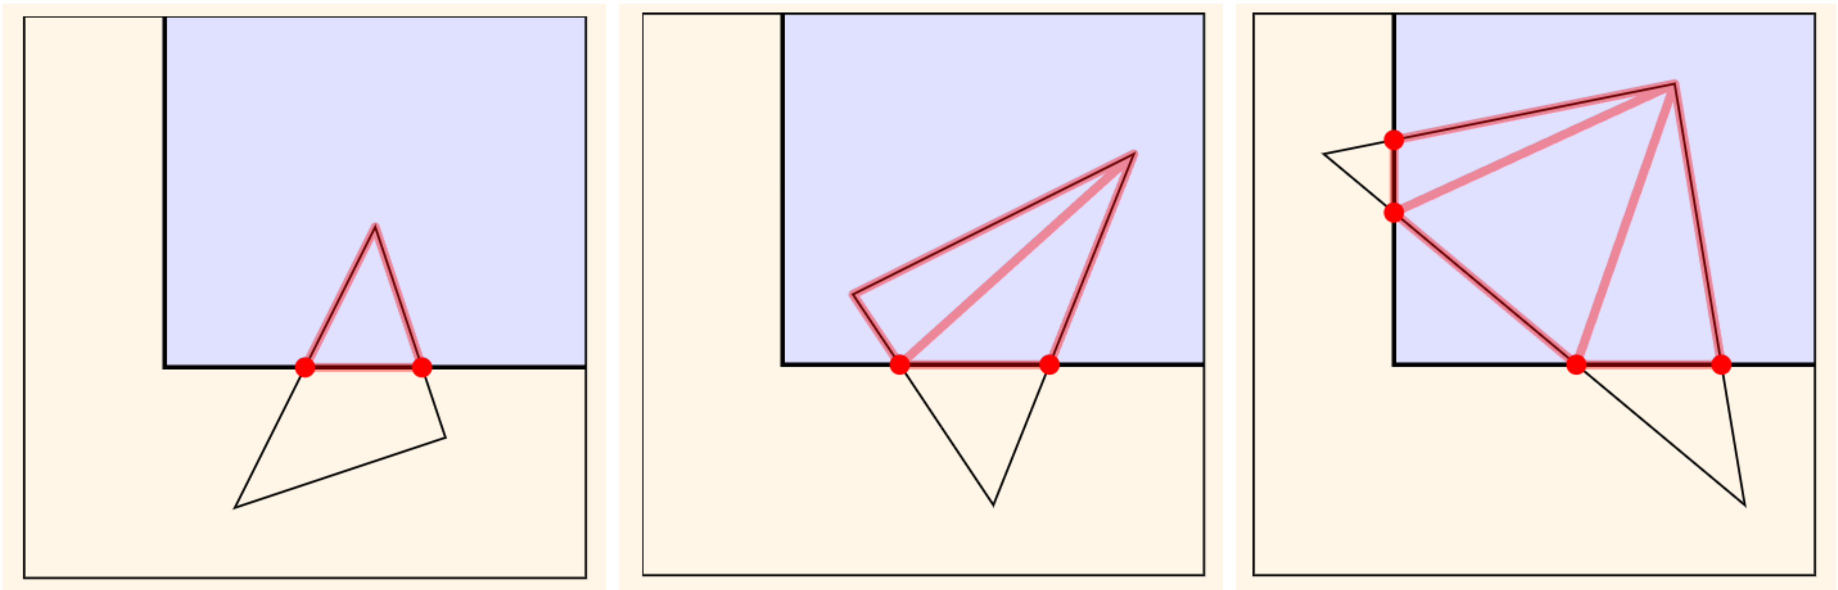
Primitive Assembly

- Convert primitives from the basic primitive types (e.g., triangle strip) into triangles
- Triangles are transformed to NDC and got **clipped** to fit within the viewport boundaries



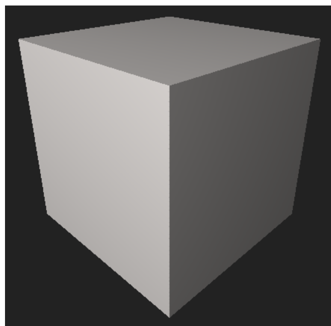
Primitive Assembly (cont.)

- **Clipping**
  - In OpenGL, clipping is performed by adding new vertices and triangulation

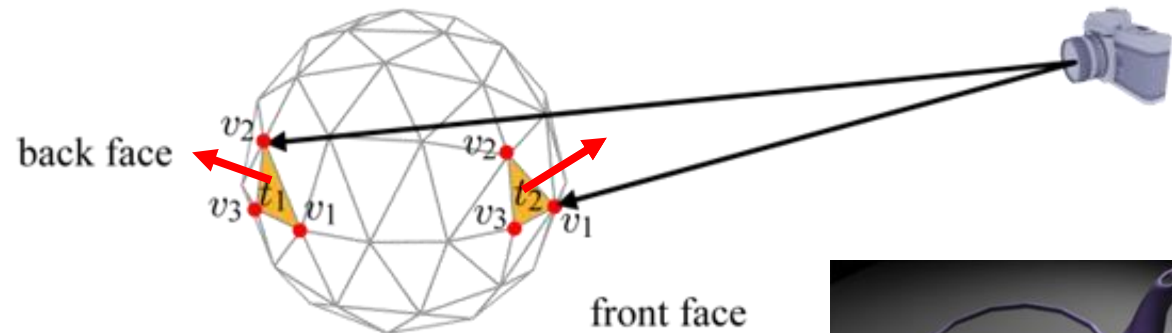


Primitive Assembly (cont.)

- **Back-face culling**
  - If a triangle is facing away from the camera, it will never be seen
  - We can cull these back-facing triangles for saving unnecessary computation



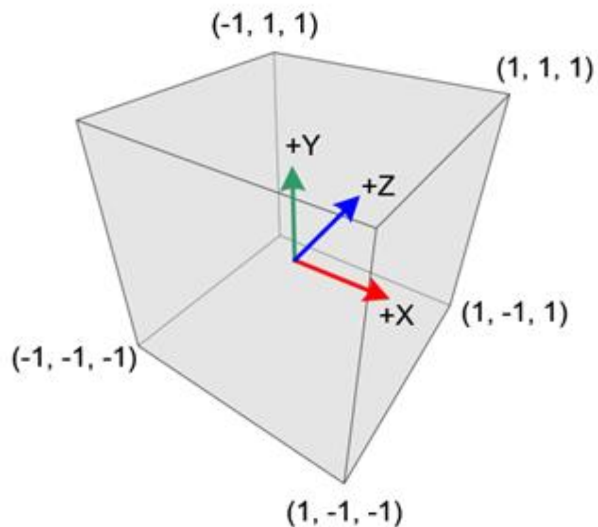
we can only see three faces from six!



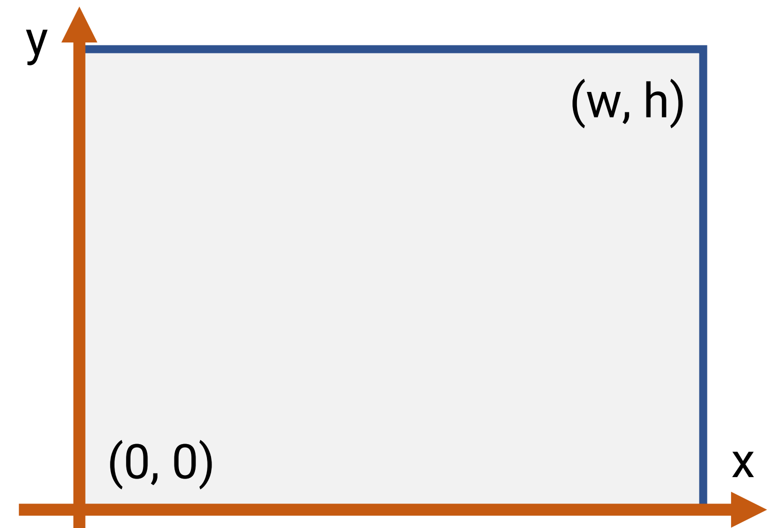
How about this case?

Primitive Assembly (cont.)

- **Screen mapping (OpenGL will handle this!)**



OpenGL NDC

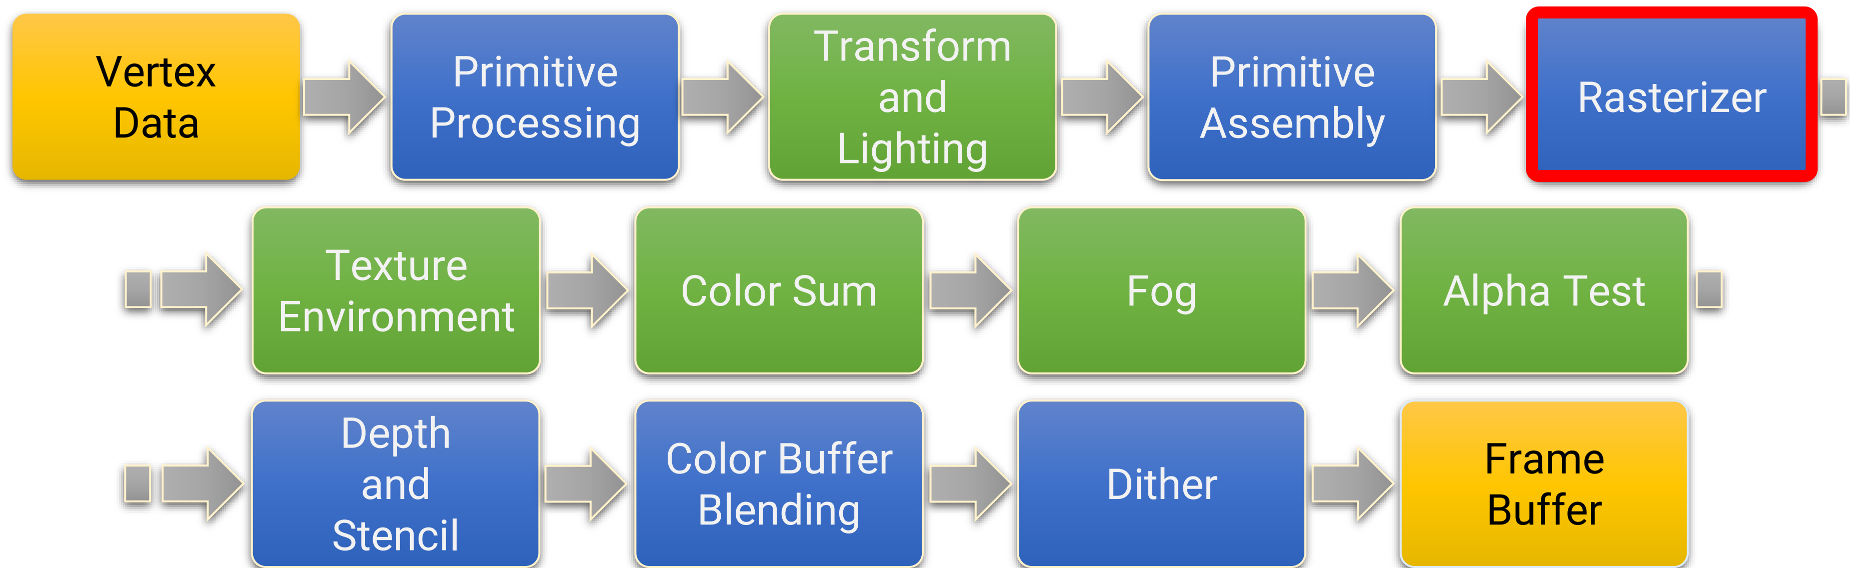


OpenGL Screen Space

$$x_s = w(x_{ndc} + 1)/2$$
$$y_s = h(y_{ndc} + 1)/2$$
$$z_s = (z_{ndc} + 1)/2$$
$$w_s = w_{ndc}$$

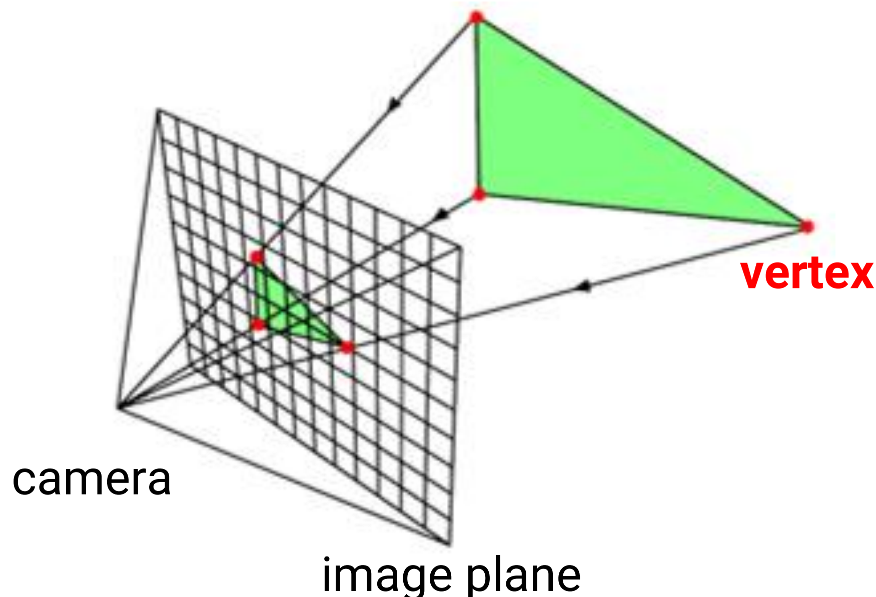
+ screen location

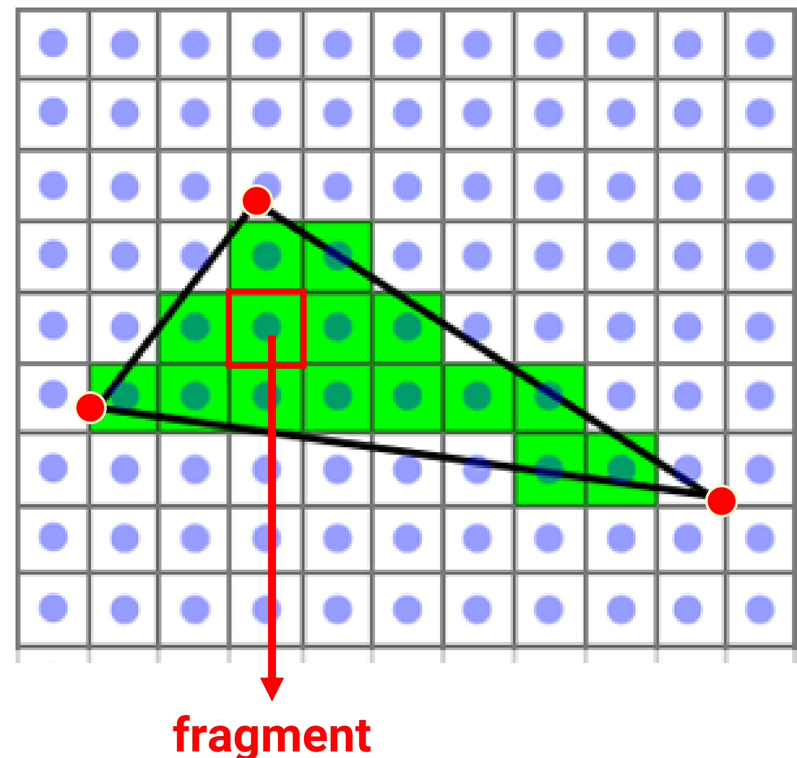
OpenGL (1.x) Fixed Function Pipeline



Rasterization

- The task of taking an **image described in vector graphics format (shapes)** and converting it into a **bitmapped/raster image (pixels)**

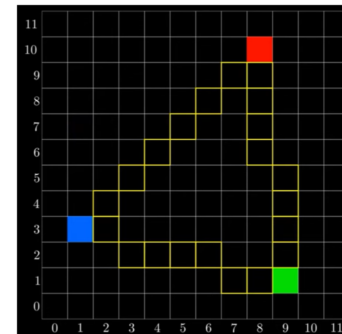


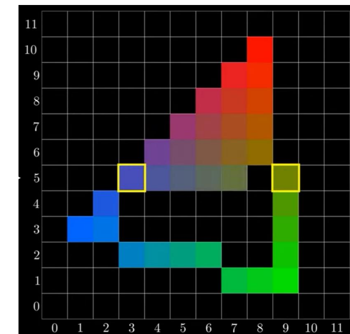


Rasterization (cont.)

- Convert **triangles** (**continuous**) into **fragments** (**discrete**, which eventually become the individual **screen pixels**)
- Vertex attributes are **interpolated** across the face, including
  - (Lighting) color — used for per-vertex lighting
  - Texture coordinate
  - Position
  - Normal
  - Anything you want to interpolate

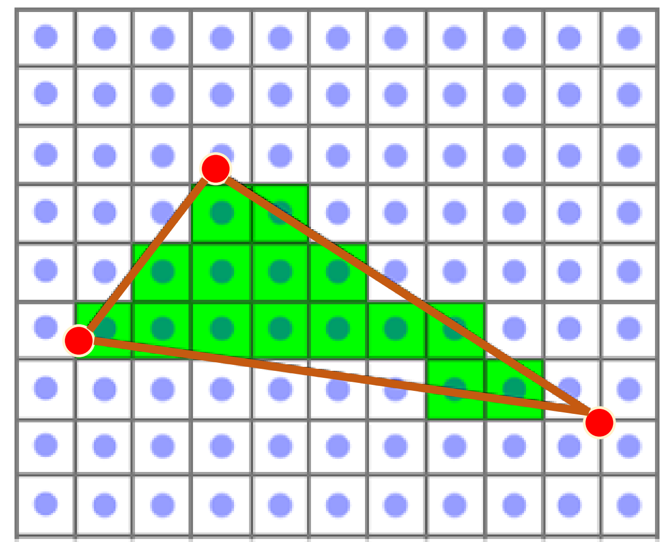
used for per-fragment lighting (after OpenGL 2.0) — applies to Position and Normal





Rasterization (cont.)

- The task of taking an **image described in vector graphics format (shapes)** and converting it into a **bitmapped/raster image (pixels)**
- **Triangle setup**
  - Setup the properties of a triangle using the vertices data
    - E.g., the equations of edges

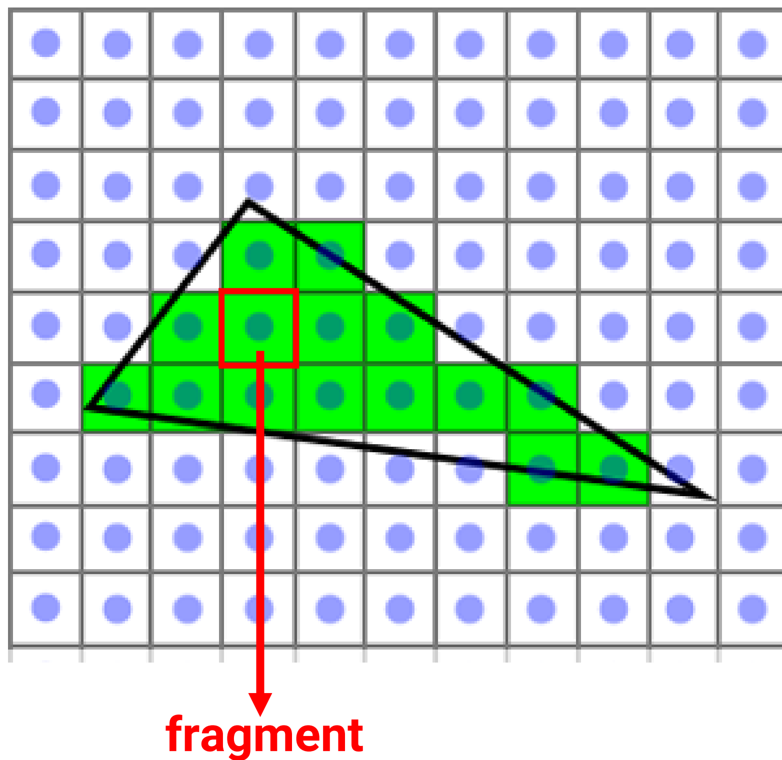


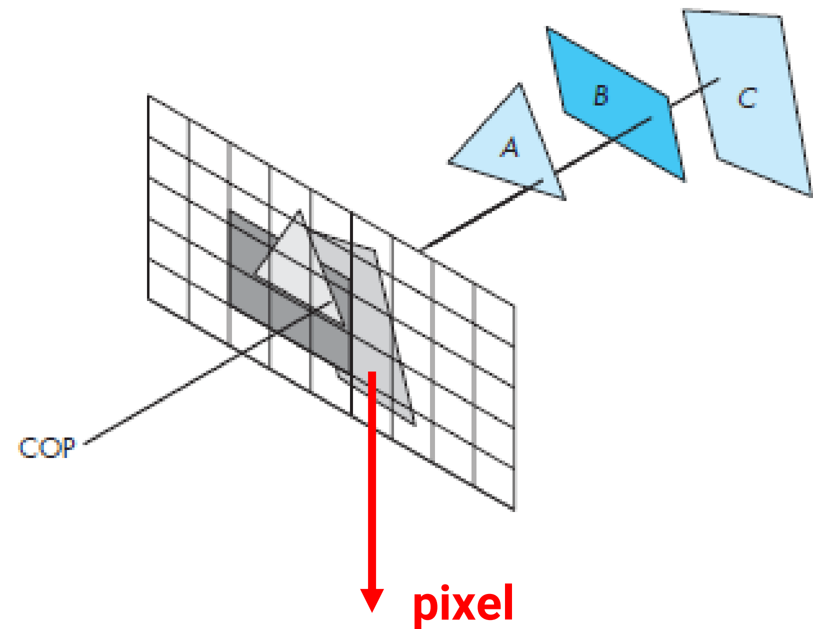
Rasterization (cont.)

- The task of taking an **image described in vector graphics format (shapes)** and converting it into a **bitmapped/raster image (pixels)**
- **Triangle setup**
  - Setup the properties of a triangle using the vertices data
    - E.g., the equations of edges
- **Fragment generation**
  - For each pixel that is inside the triangle in the screen space, generate a **fragments**
  - Obtain **per-fragment data** using **interpolation**

Rasterization (cont.)

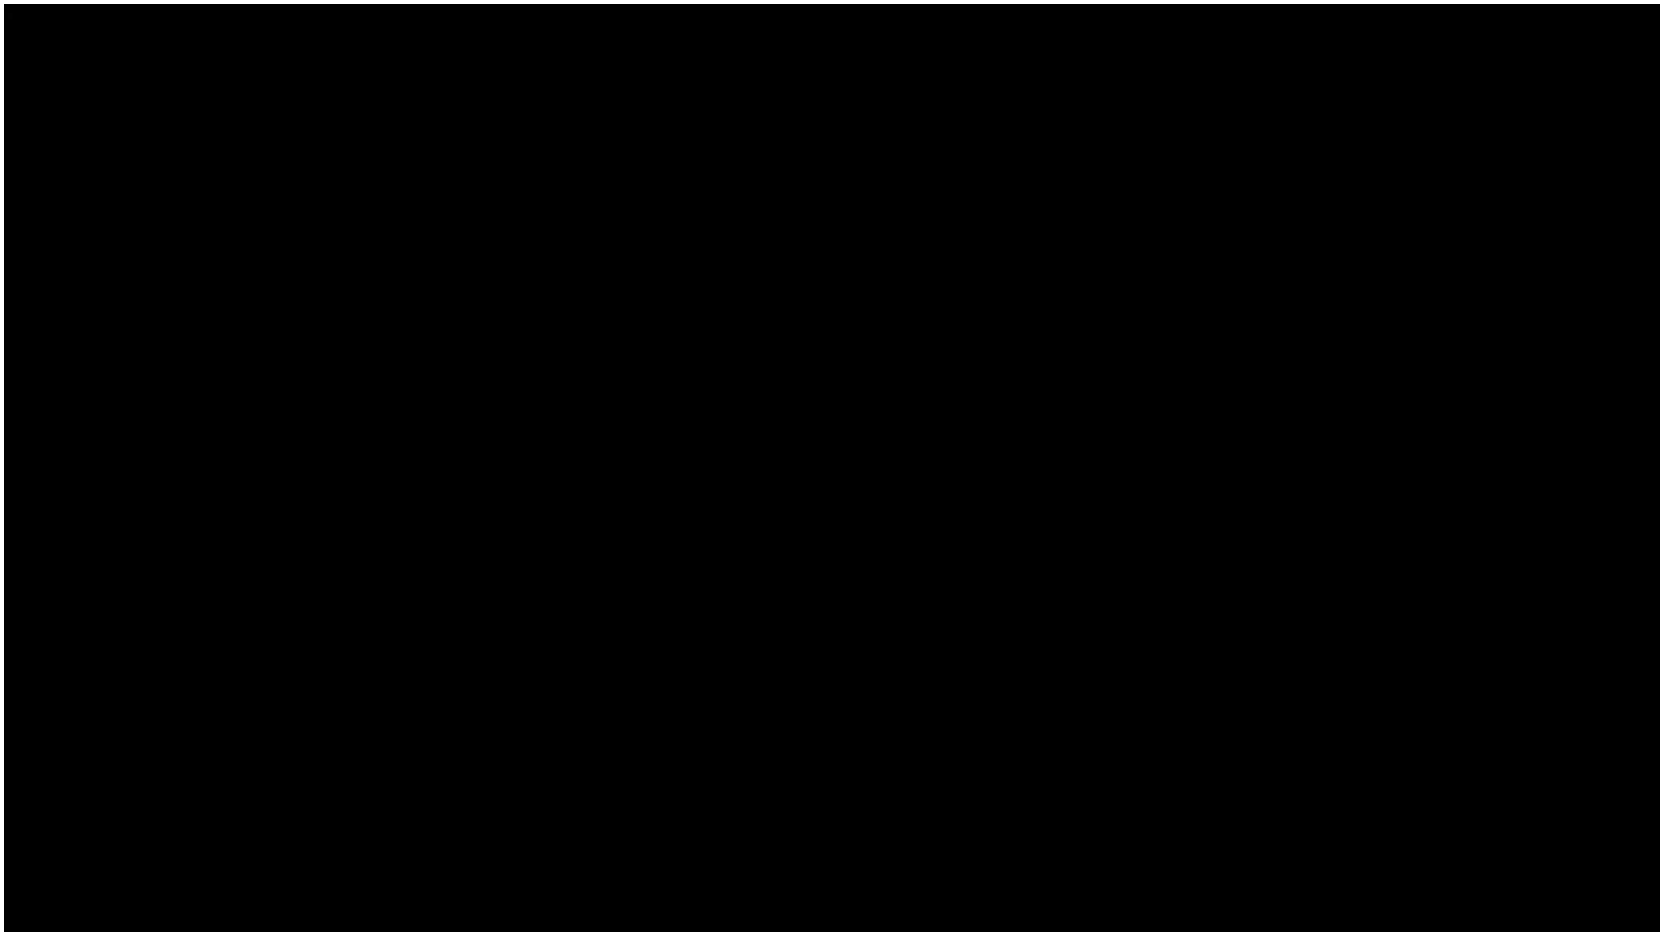
- Fragment != Pixel





Rasterization (cont.)

- https://www.youtube.com/watch?v=t7Ztio8cwqM



Digital Differential Analyzer (DDA)

- Draw a line segment passing through $(x_1, y_1) = (1, 1)$ and $(x_2, y_2) = (7, 5)$

$$y = mx + b$$

$$m = \frac{y_2 - y_1}{x_2 - x_1} = \frac{\Delta y}{\Delta x}$$

slope

$$\Delta y = m\Delta x = m$$ (if Δx = 1)

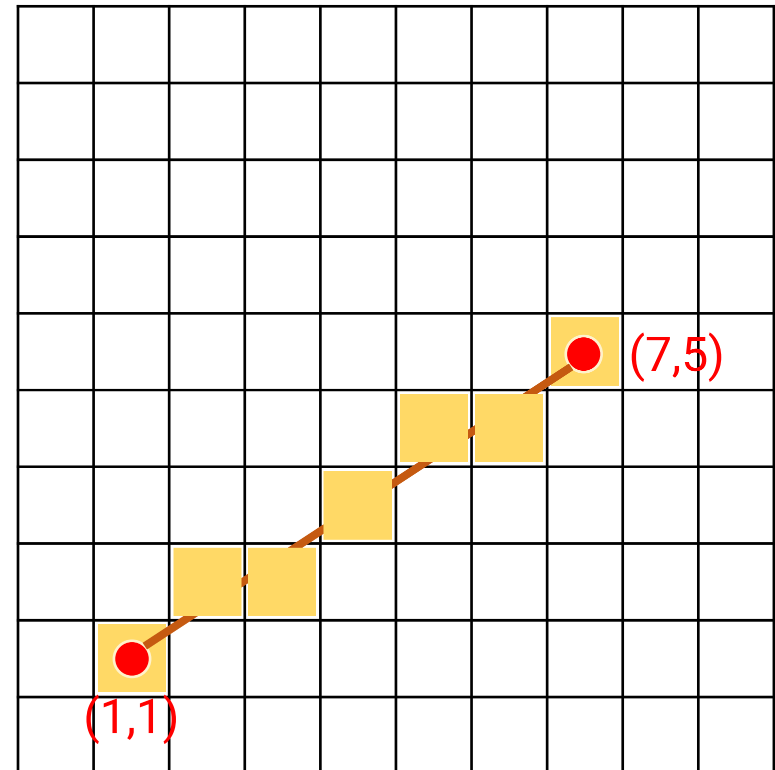
$x_a = 2$ ➔ $y_a = y_1 + m = 1.667$ ➔ (2, 1.667) (2, 2)

$x_b = 3$ ➔ $y_b = y_a + m = 2.333$ ➔ (3, 2.333) (3, 2)

$x_c = 4$ ➔ $y_c = y_b + m = 3.000$ ➔ (4, 3.000) (4, 3)

$x_d = 5$ ➔ $y_d = y_c + m = 3.667$ ➔ (5, 3.667) (5, 4)

$x_e = 6$ ➔ $y_e = y_d + m = 4.333$ ➔ (6, 4.333) (6, 4)



floating-point addition / comparison

Bresenham Algorithm

- Draw a line segment passing through $(x_1, y_1) = (1, 1)$ and $(x_2, y_2) = (7, 5)$

$$y = mx + b$$

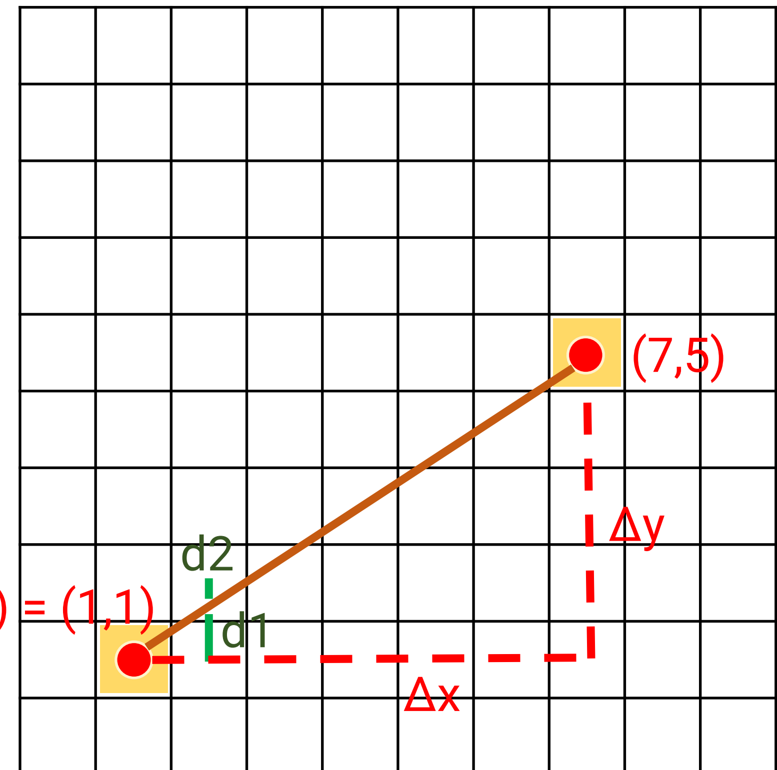
$$m = \frac{y_2 - y_1}{x_2 - x_1} = \frac{\Delta y}{\Delta x}$$

$$d1 = y - y_i = (m(x_i + 1) + b) - y_i$$

$$d2 = (y_i + 1) - y \ = y_i + 1 - (m(x_i + 1) + b)$$

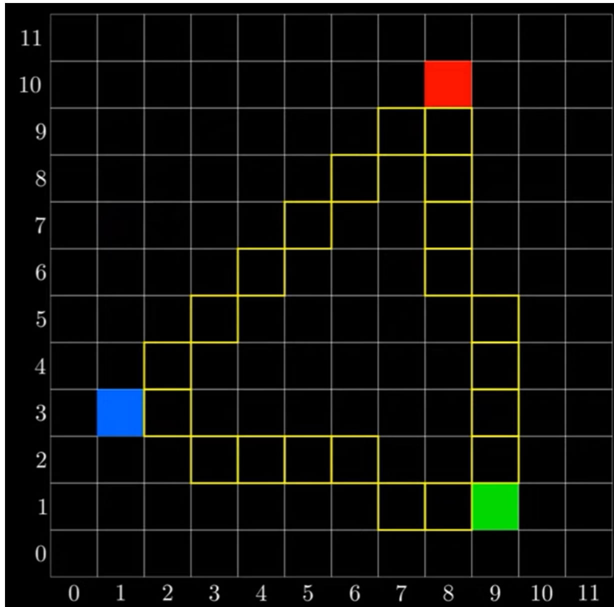
$$d1 - d2 = 2m(x_i + 1) - 2y_i + 2b - 1$$

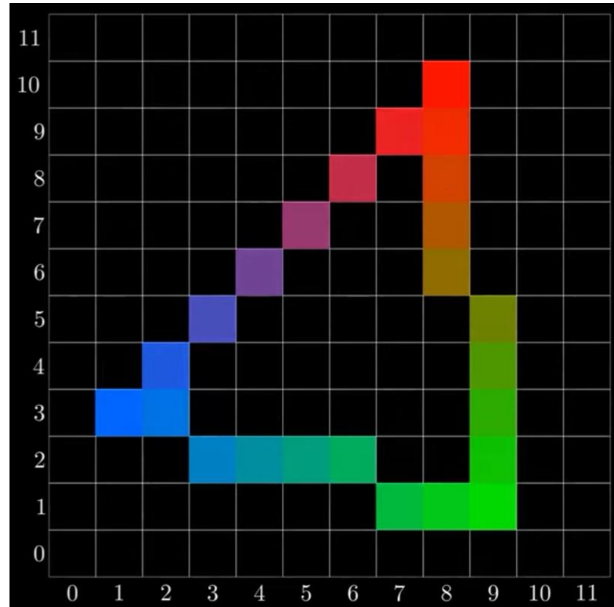
$$\Delta x(d1 - d2) = 2\Delta y x_i - 2\Delta x y_i + c$$



integer multiplication / comparison

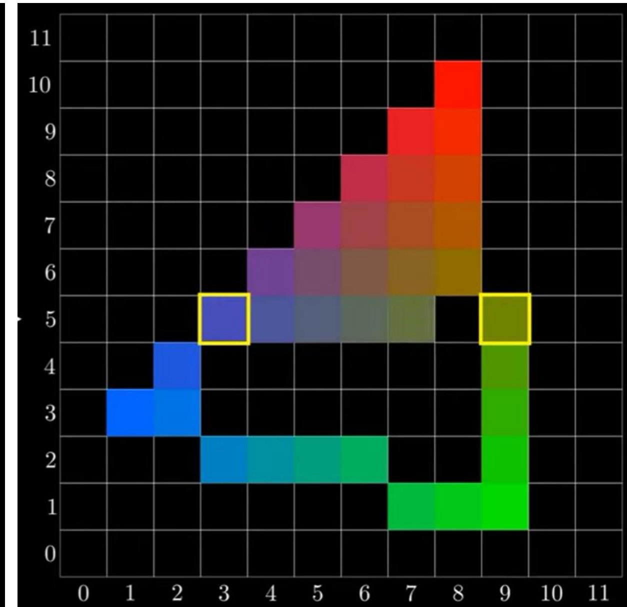
Scanline Rasterization





Attributes interpolation of edge pixels using vertices

(interpolate y dir.)

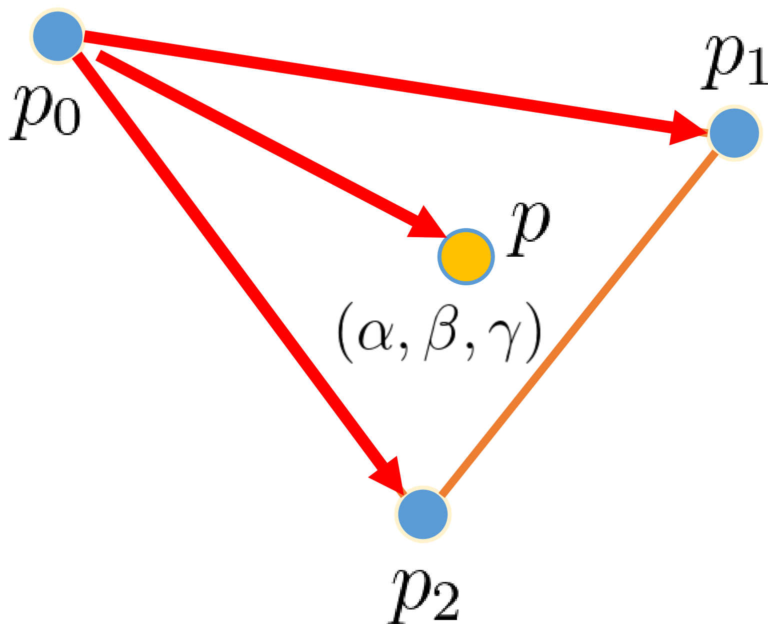


Attributes interpolation of inner pixels using edge points

(interpolate x dir.)

Barycentric Coordinates

- Barycentric coordinates inside a triangle



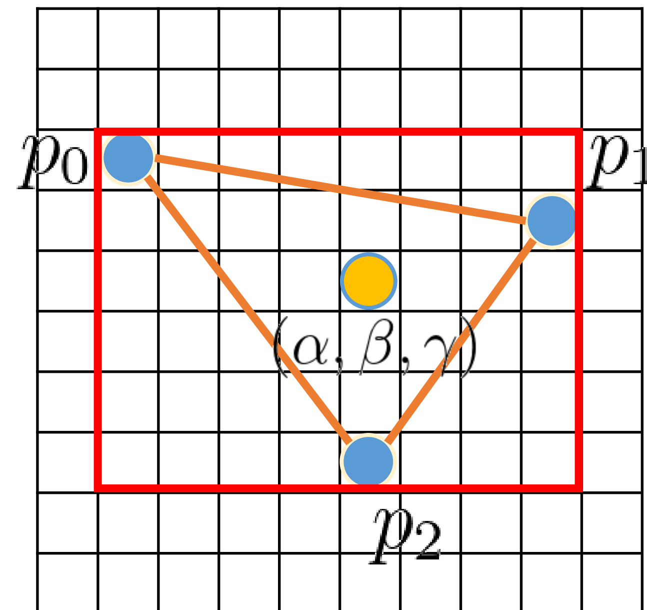
$$p = p_0 + \beta(p_1 - p_0) + \gamma(p_2 - p_0)$$
$$= (1 - \beta - \gamma)p_0 + \beta p_1 + \gamma p_2$$
$$= \alpha p_0 + \beta p_1 + \gamma p_2$$
$$\alpha + \beta + \gamma = 1$$

The values $\alpha, \beta, \gamma \in [0, 1]$ **if and only if *p* is inside the triangle**

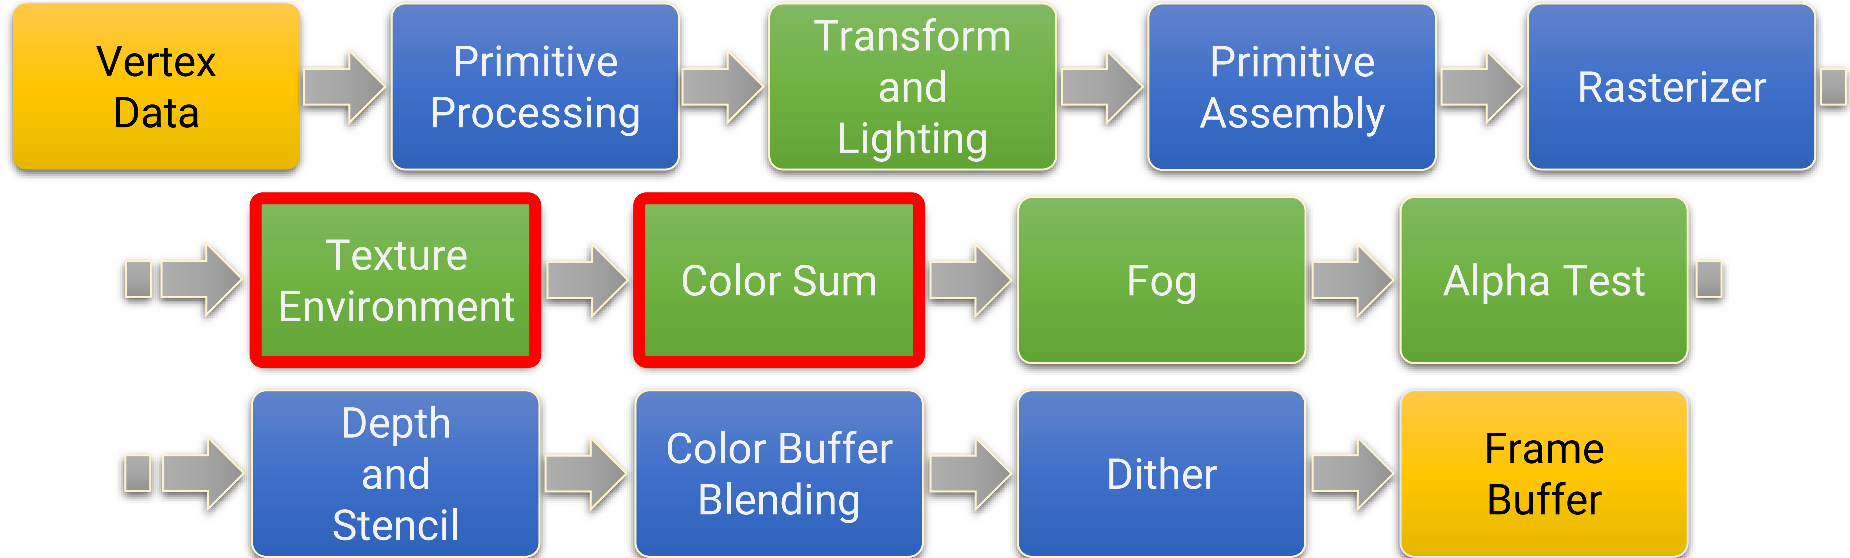
Barycentric Coordinates (cont.)

- Compute the 2D bounding box of the 2D triangle
- For each pixel inside the bounding box, compute its barycentric coordinates
- If the coordinates are all ≥ 0 and ≤ 1, the pixel is covered by the triangle

The barycentric coordinates *α, β, γ* can be used to interpolate vertex attributes directly

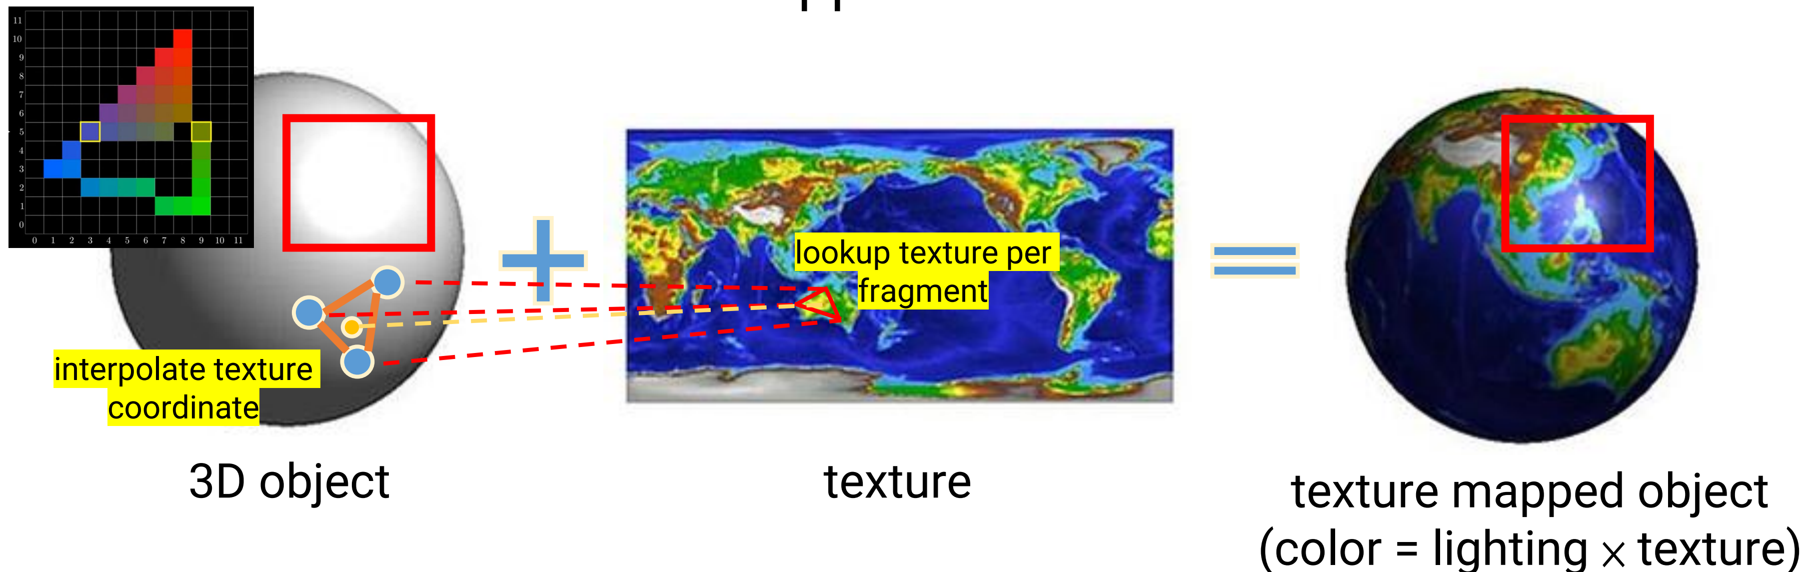


OpenGL (1.x) Fixed Function Pipeline

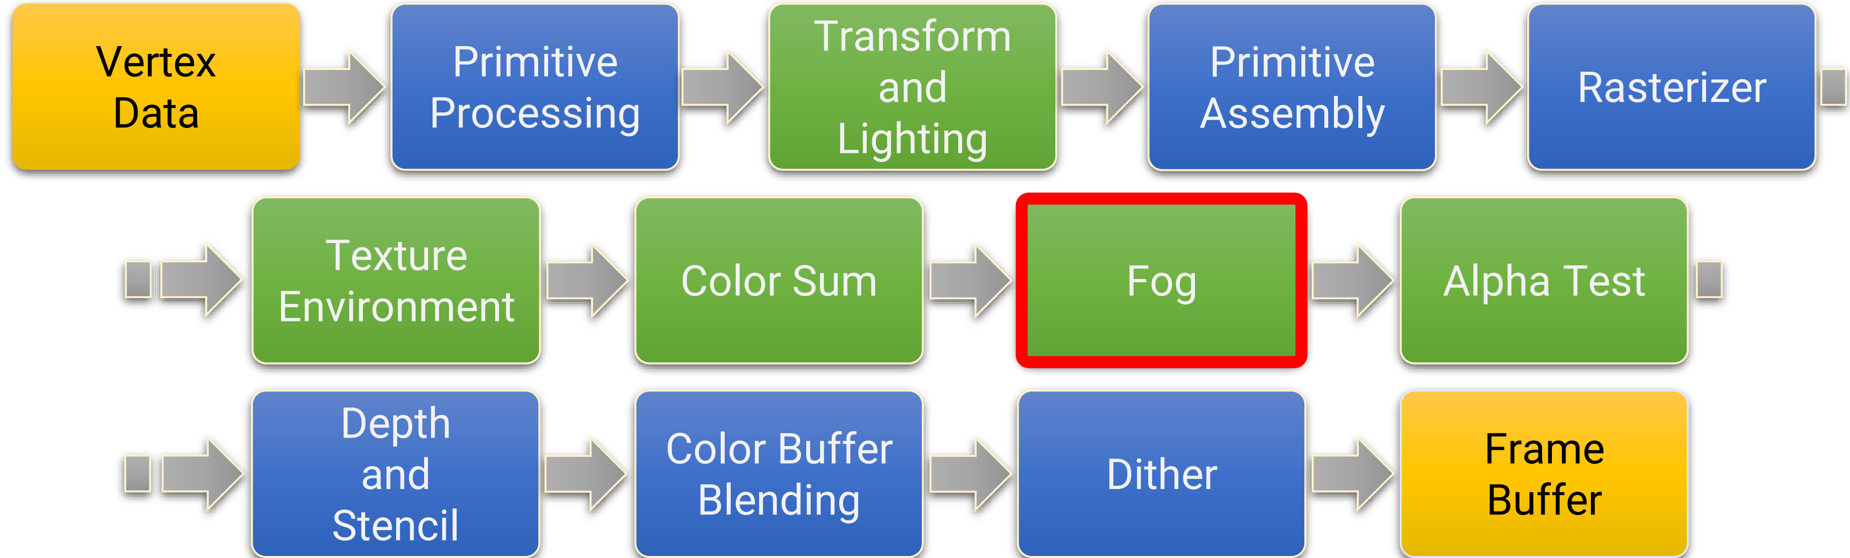


Texture Environment and Color Sum

- **Texture Environment**
  - Apply the textures to the fragments
- **Color Sum**
  - Used to add-in a secondary color to the geometry after the textures have been applied



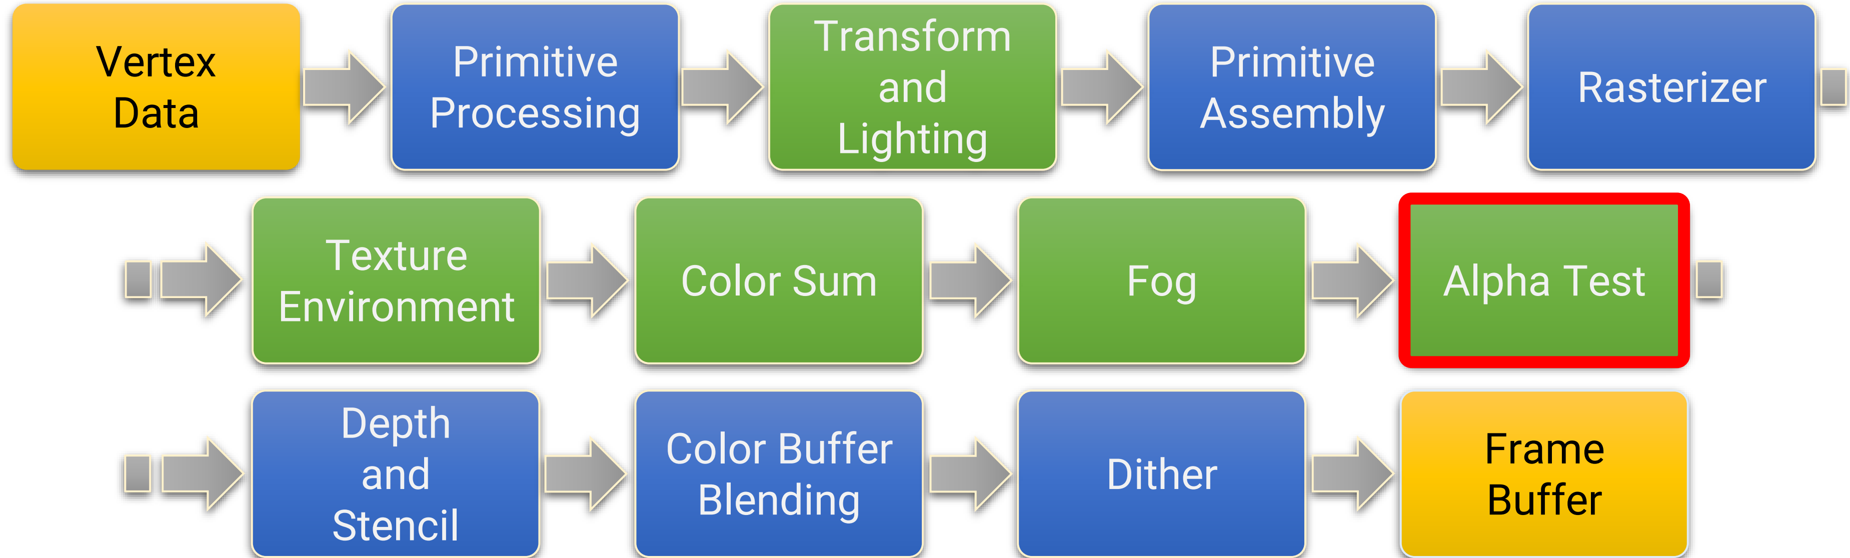
OpenGL (1.x) Fixed Function Pipeline



Fog

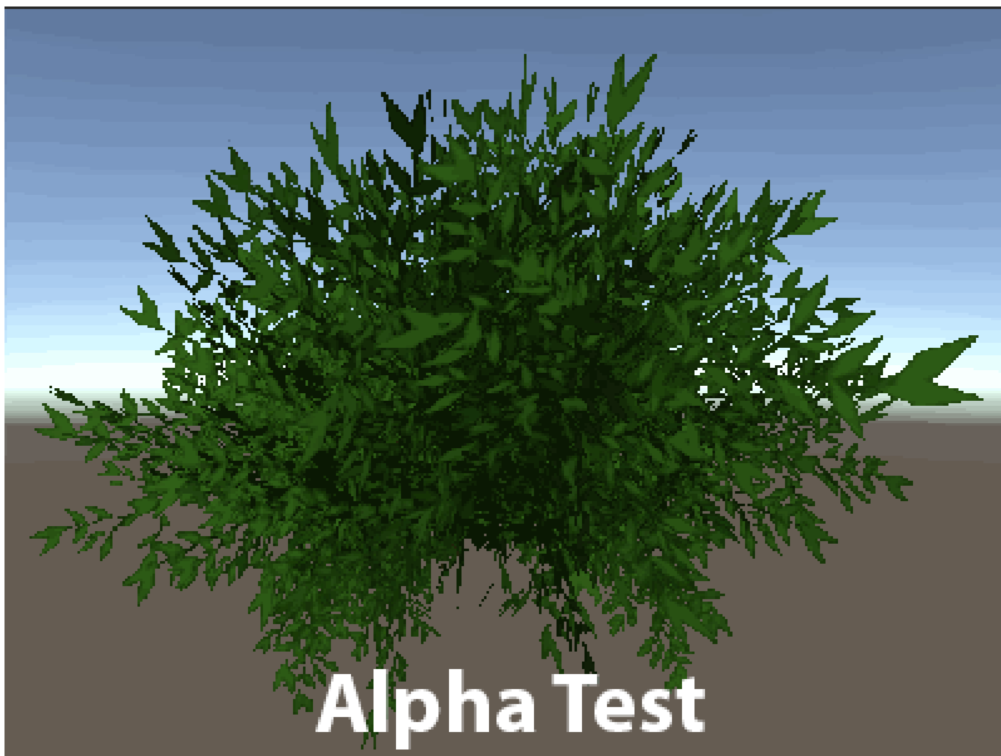
- Simulate the effect of geometry fadeout as dimmed by fog
- Linearly blend the fragment color with the fog color

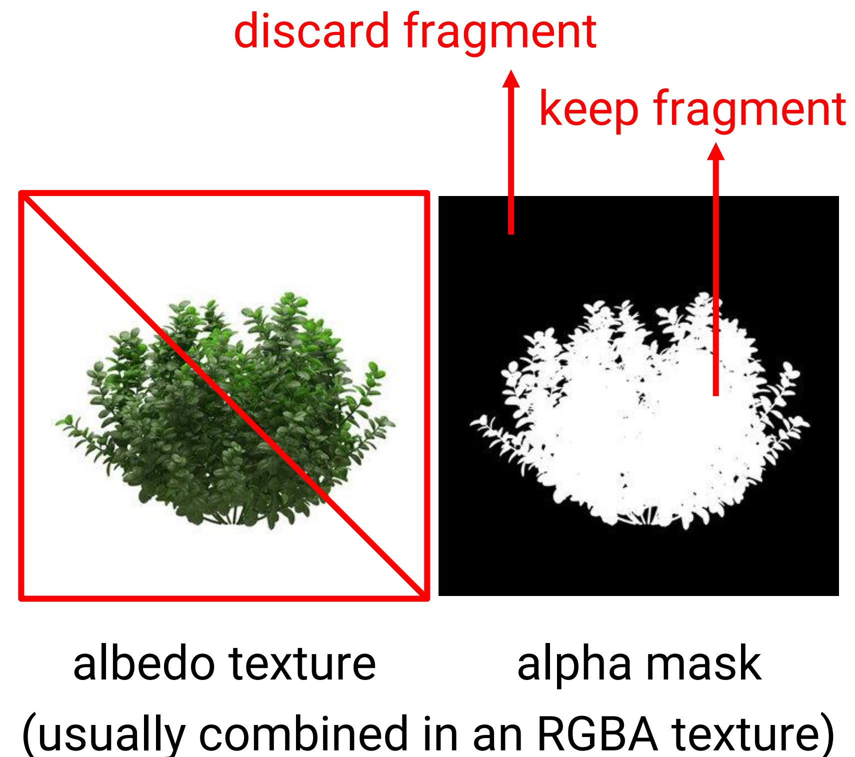
OpenGL (1.x) Fixed Function Pipeline



Alpha Test

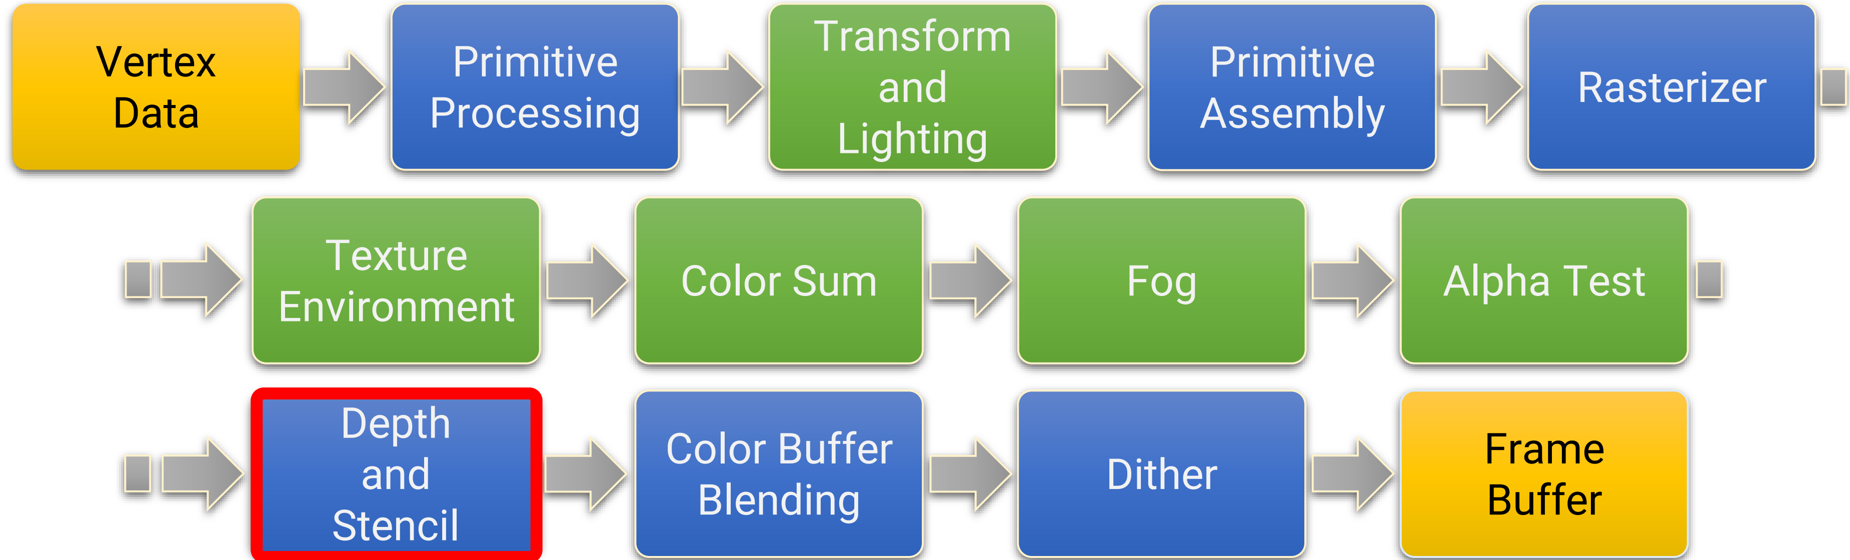
- Discard fragments if their alpha values are below a certain threshold





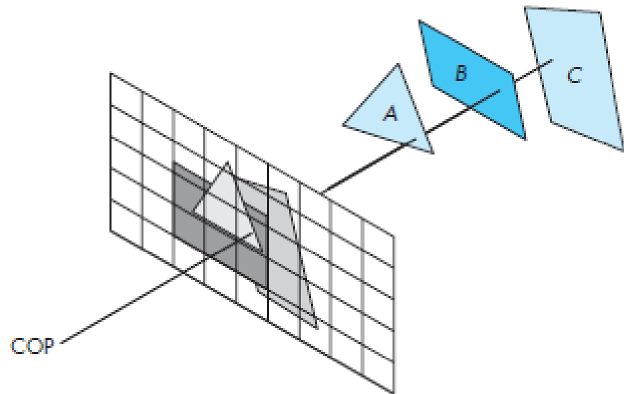
albedo texture alpha mask
(usually combined in an RGBA texture)

OpenGL (1.x) Fixed Function Pipeline



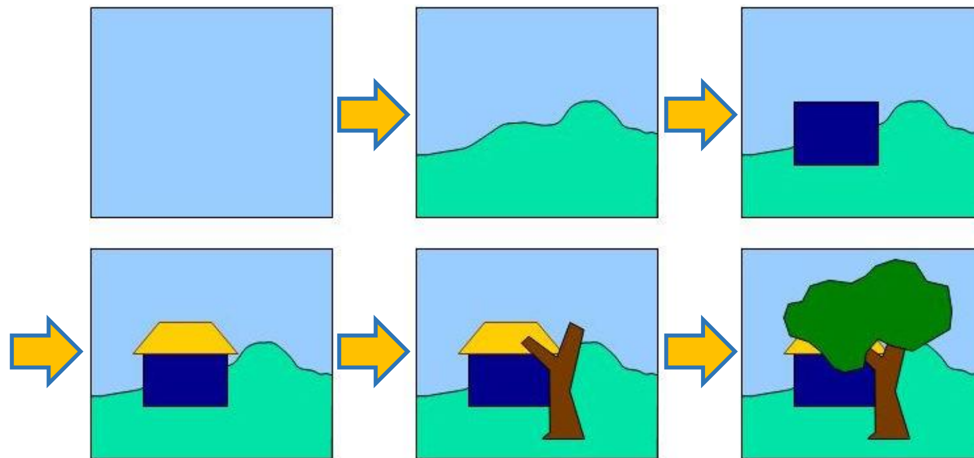
Depth Test

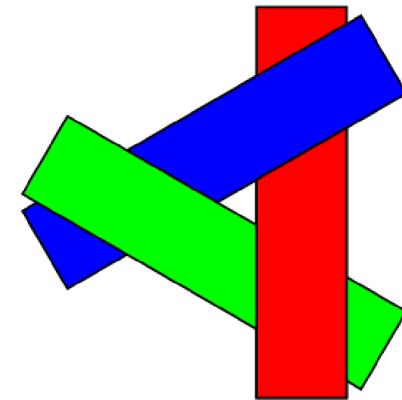
- Used for **hidden surface removal**
  - Only show the **closest** surfaces to the camera at each pixel



Depth Test (cont.)

- Used for **hidden surface removal**
  - Only show the **closest** surfaces to the camera at each pixel
- Earlier approach: painter's algorithm

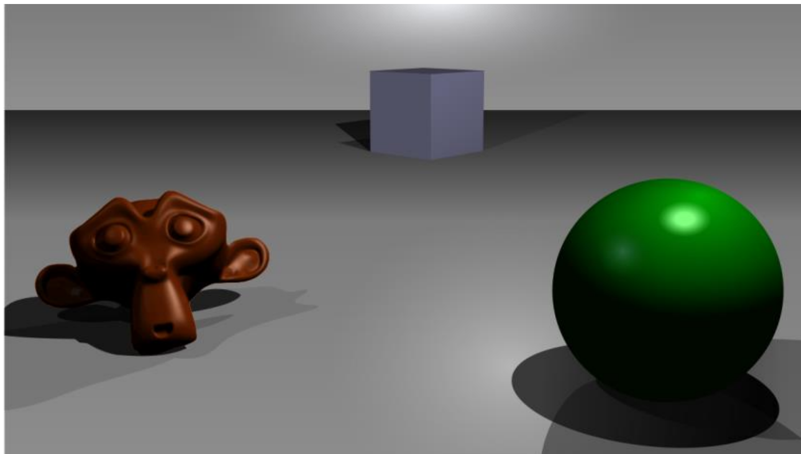




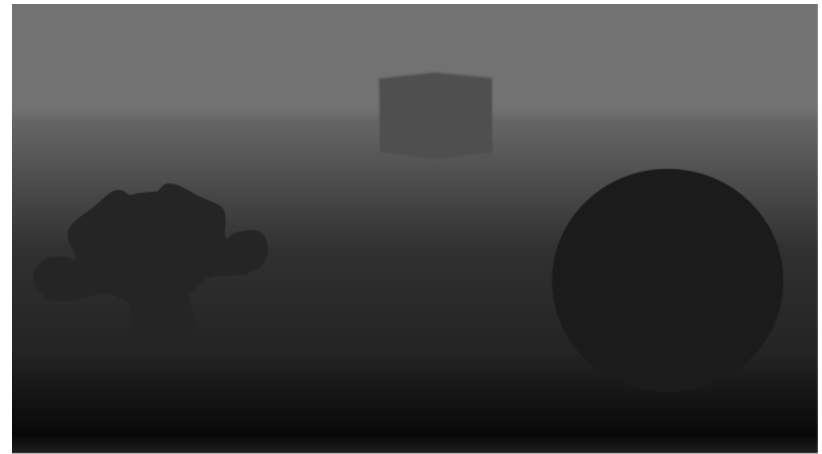
How about this?
(cyclical overlapping)

Depth Test (cont.)

- **Z-buffer**
  - An additional buffer used to maintain the z value of the closest surface to a pixel
  - Discard fragments if they have larger depth values than the ones stored in their corresponding positions in the Z buffer



color frame buffer



Z (depth) buffer

Z-Buffer

- Z-buffer update

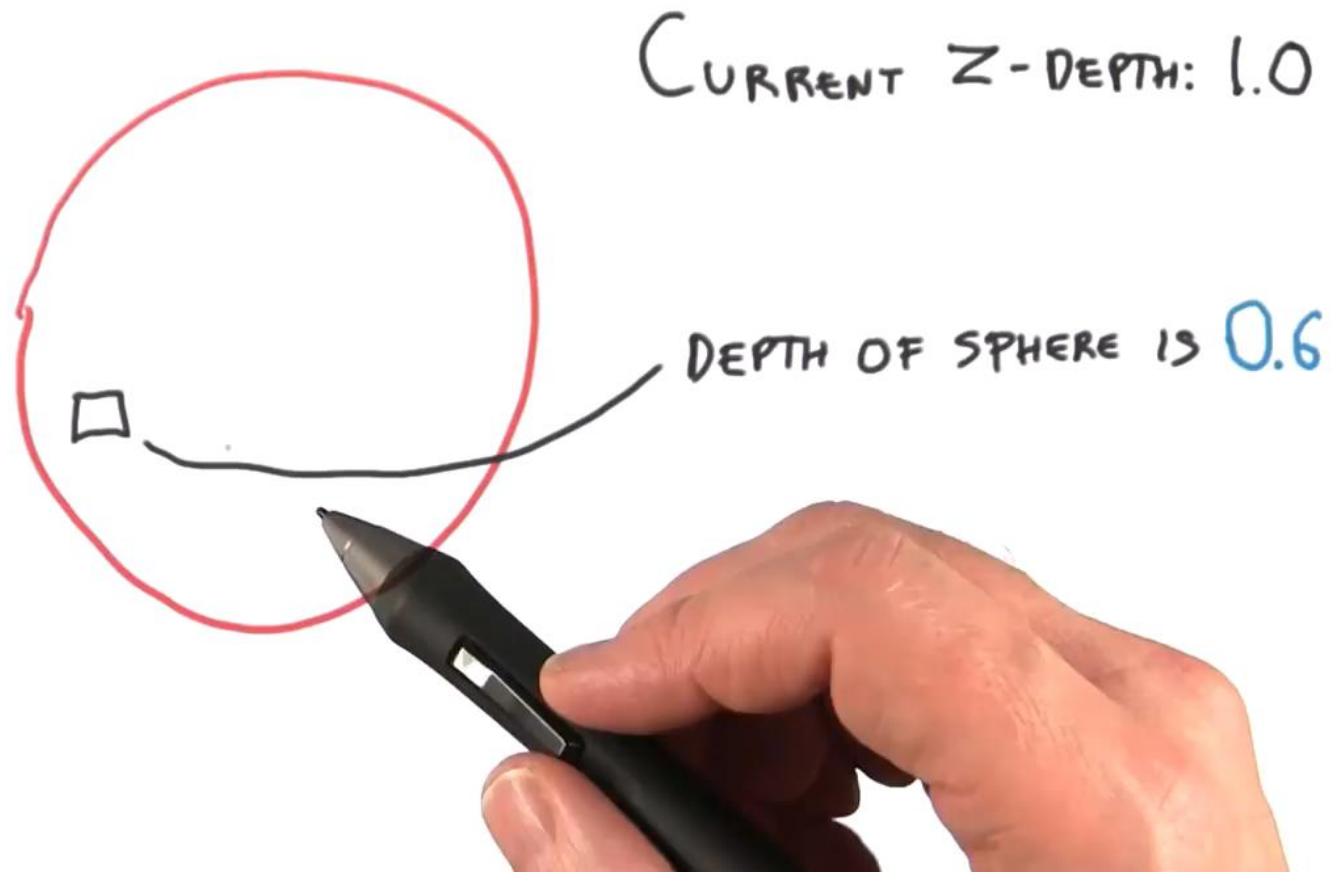
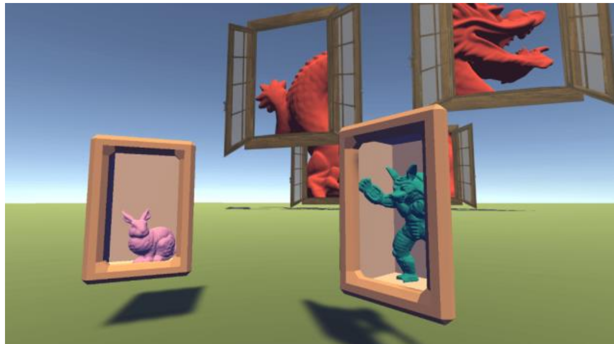
Z-Buffer (cont.)

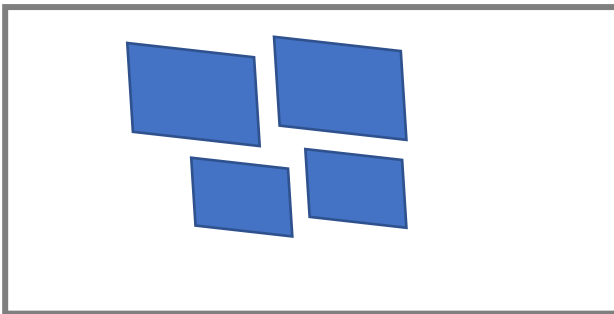
- https://www.youtube.com/watch?v=yhwg_O5HBwQ



Stencil Test

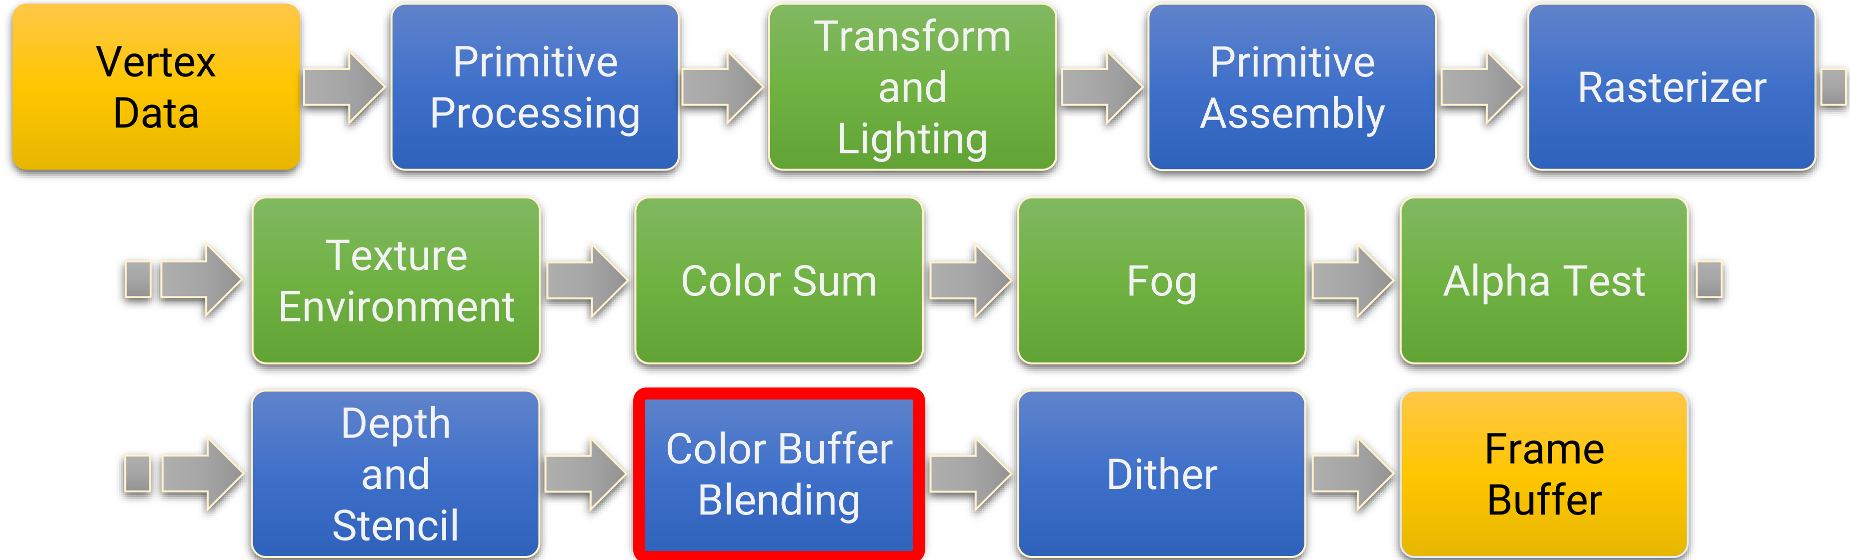
- Used to discard fragments that fail a stencil comparison, based on the content of the stencil buffer





stencil buffer

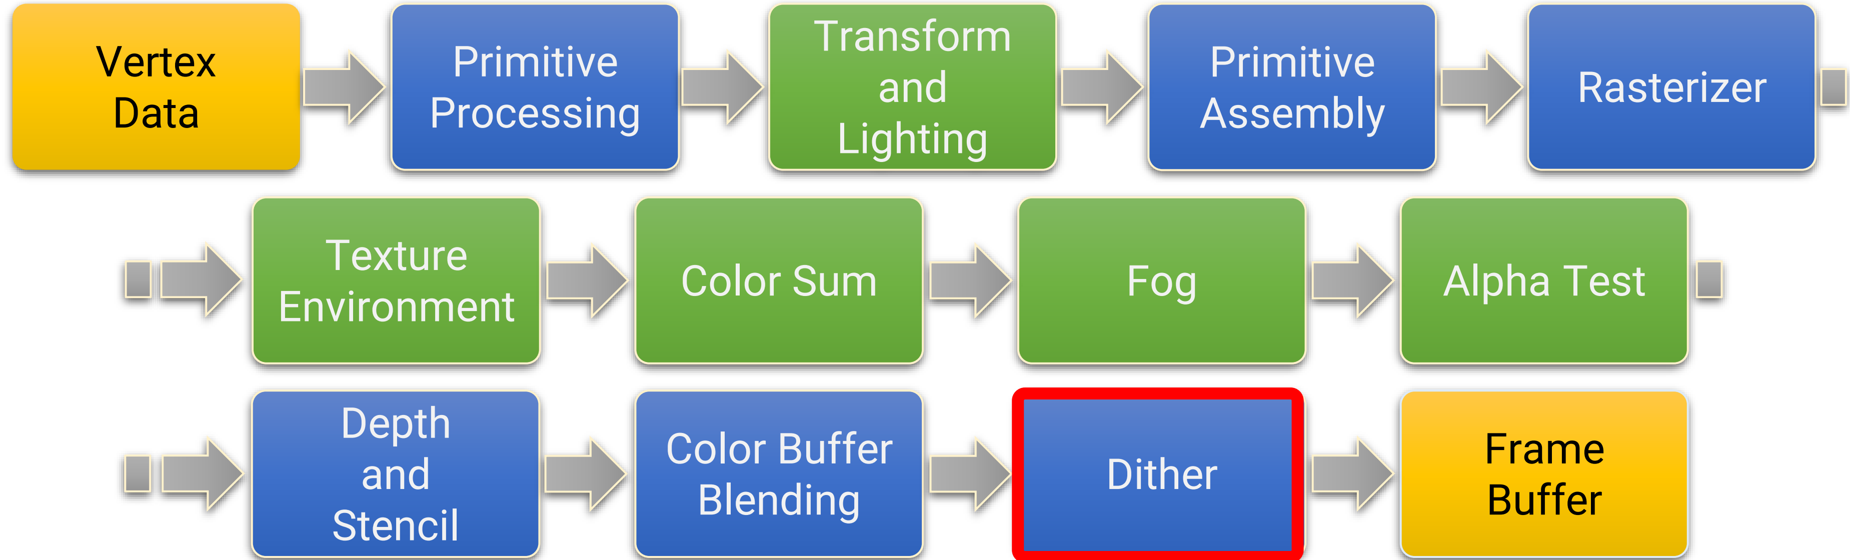
OpenGL (1.x) Fixed Function Pipeline



Color Buffer Blending

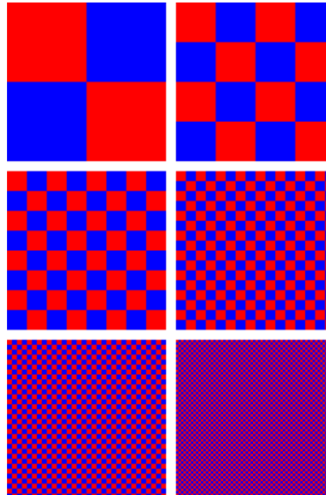
- Blend the color of fragments with the previous results in the frame buffer based on the **alpha values** of the current fragments, as well as the **blend function** and the **blend equations**

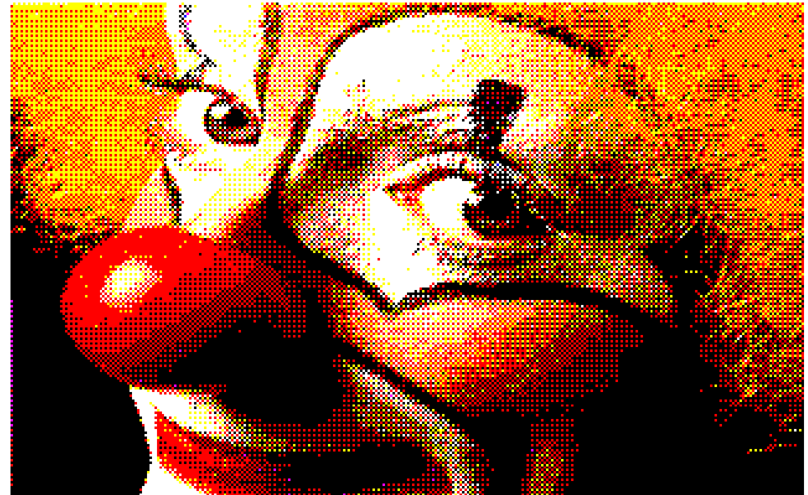
OpenGL (1.x) Fixed Function Pipeline



Dither

- If a color palette is used, OpenGL will try to simulate a larger color palette by mixing colors in close proximity
- Areas of a single color are replaced by a pattern of dots of several different colors, in such a way that optical mixing in the eye produces a color close to the desired one





Summary of Fixed Function Pipeline

- An 3D object will come to the screen with a series of "fixed" steps
  - Fixed transformation (MVP matrix)
  - **Fixed (Phong) lighting model on vertices**
  - **Fixed modulation of lighting color and texture color**
    - Color = Lighting $\times$ Texture

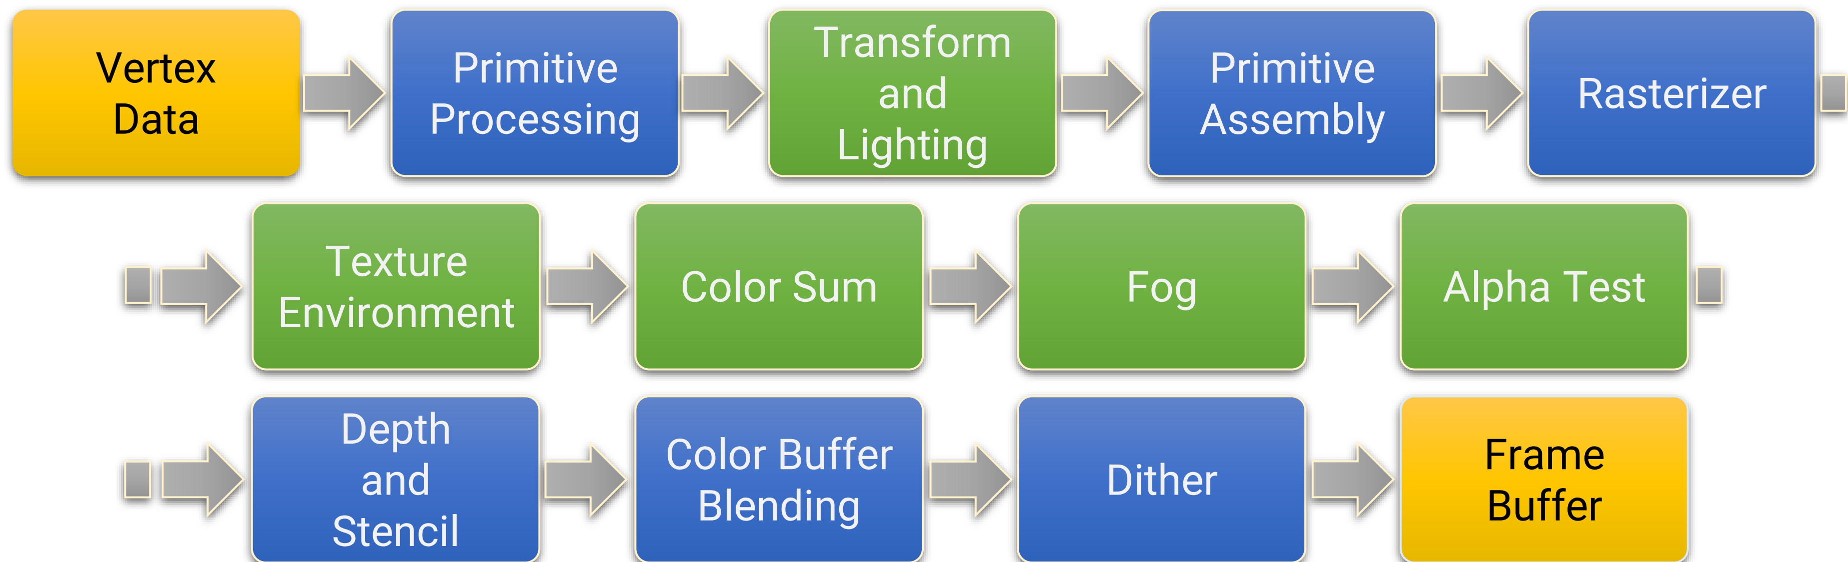
- **We would like more flexibility!**

Outline

- GPU graphics pipeline
- OpenGL graphics pipeline 1.x
- **OpenGL graphics pipeline 2.0**
- OpenGL and shader implementation

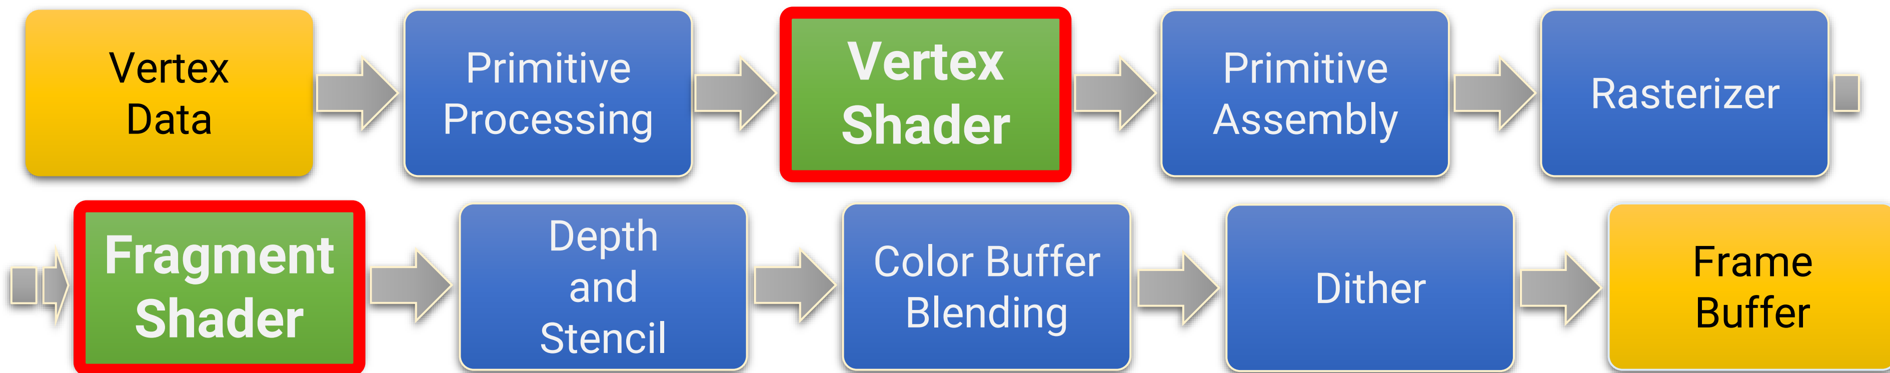
Recap: OpenGL (1.x) Fixed Function Pipeline

- All the functions performed by OpenGL are **fixed** and **could not** be modified except through the manipulation of the **rendering states**
- The stages shown in green have been replaced by **shaders**



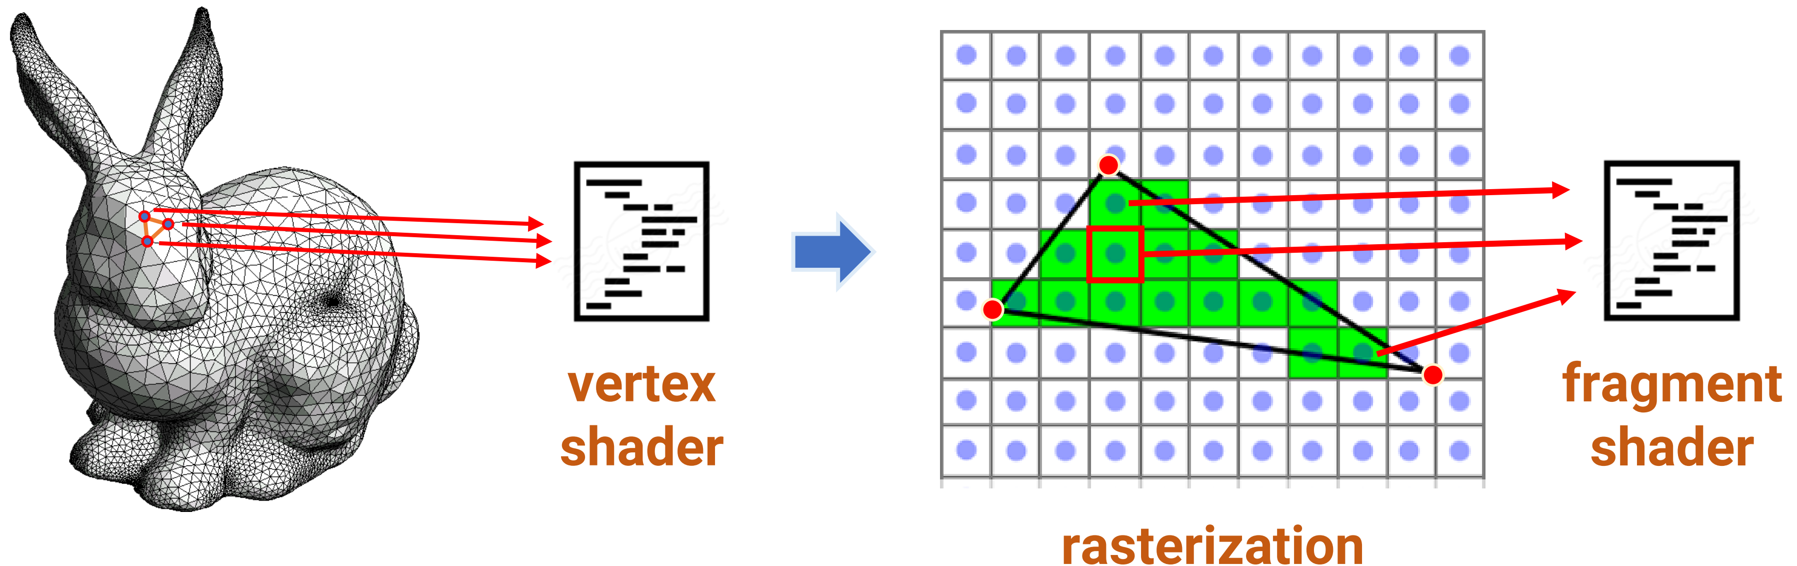
OpenGL (2.0) Graphics Pipeline

- Released in 2004
- Provide the ability to **programmatically** define the vertex transformation and lighting and the fragment operations (with small GPU programs called **shaders**)



Vertex Shader and Fragment Shader

- **Important concepts**
  - The vertex shader runs **per vertex**
  - The fragment shader runs **per (rasterized) fragment**



Vertex Shader (Run per Vertex)

- Give the programmers more **flexibility** regarding
  - **How the vertices are transformed**
    - We can also choose not to transform the vertices at all
  - **How the lighting is computed**
    - We can also choose to compute lighting in the fragment shader (per-fragment lighting)
- However, ***with great power, comes great responsibility***
  - Programmers have to implement the functions provided by the fixed pipeline on their own
  - The primary responsibility of the vertex shader program is to **transform the vertex position into Clip Space**
    - Commonly, this is done by multiplying the vertex with the **model-view-projection** matrix

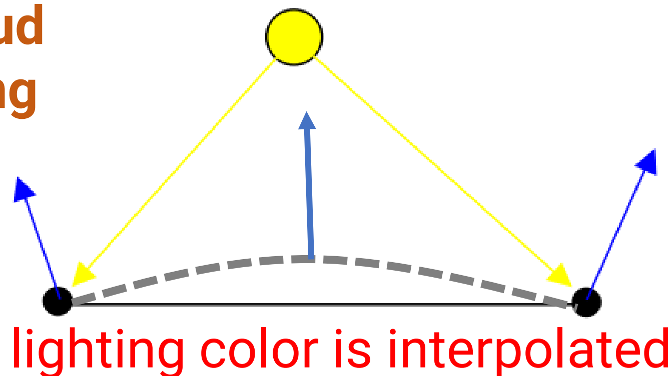
Fragment Shader (Run per Fragment)

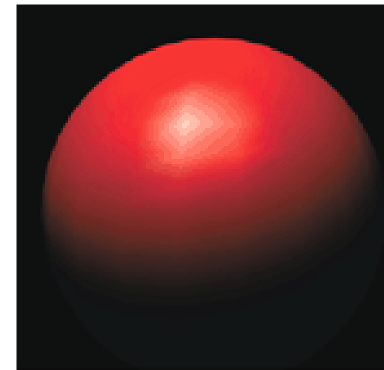
- Replace the **texture blending**, **color sum**, **fog**, and **alpha test** operations from the fixed function pipeline
- Graphics programmers have to write a **fragment program** to perform these operations (of course, you can omit them if you do not care!)
- The primary responsibility of the fragment program is to **determine the final color of the fragment**
- Allow different lighting and fog model, as well as an arbitrary combination of lighting and texture
- Allow for techniques such as per-pixel lighting, bump, normal mapping, etc.

Per-Fragment Shading

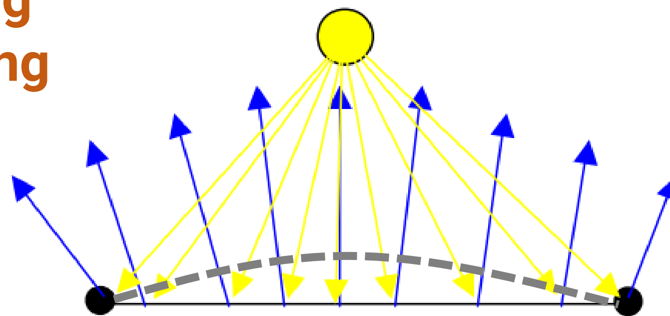
- Problem with Gouraud shading
- Phong shading (instead of Gouraud shading)

Gouraud shading





Phong shading



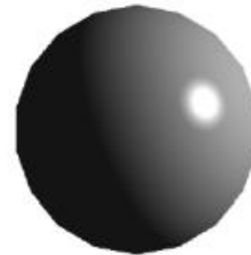
surface normal is interpolated (how? Rasterization!)

Per-Fragment Shading (cont.)

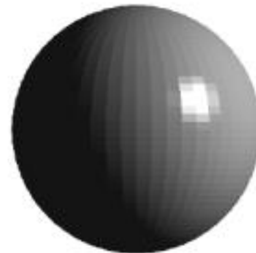
flat shading | Gouraud shading | Phong shading

(a_1)

(b_1)

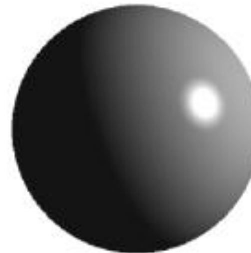


(c_1)

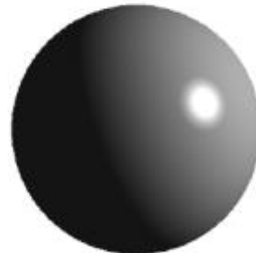


(a_2)

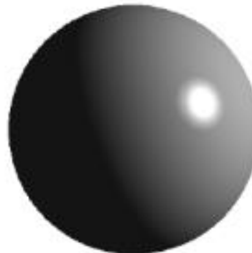
(b_2)



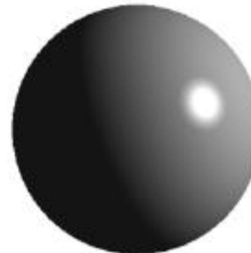
(c_2)



(a_3)



(b_3)

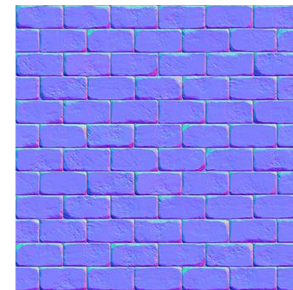


(c_3)

Per-Fragment Shading (cont.)

- Normal mapping

We will talk about this when introducing Textures



Modern Graphics Pipeline

- Modern graphics pipeline comprised more programmable (shader) stages, such as
  - **Geometry shader** in OpenGL 3.2
  - **Tessellation control shader** and **tessellation evaluation shader** in OpenGL 4.0
  - **Compute shader** in OpenGL 4.3
  - **Mesh shader** in OpenGL ?
- Hopefully, we could have time to introduce these shaders later in this semester
