# The Rendering Equation

- Proposed by Kajiya [1986]

$$L(x, \omega_o) = L_e(x, \omega_o) + \int_{\Omega} L_i(x, \omega_i) f_r(x, \omega_o \leftarrow \omega_i) (N(x) \cdot \omega_i) d\omega_i$$

emitted radiance      incident radiance      reflected radiance  
 geometry term  
 $L_i(x, \omega_i)$        $f_r(x, \omega_o \leftarrow \omega_i)$        $(N(x) \cdot \omega_i)$   
 bidirectional reflectance distribution function  
 Integral of all directions      (BRDF)

# Formal Material Representation

- In **Physically-based Rendering (PBR)**, the characteristic of a material is usually defined by **Bidirectional Reflectance Distribution Function (BRDF)**

$$f_r(x, \omega_o \leftarrow \omega_i)$$

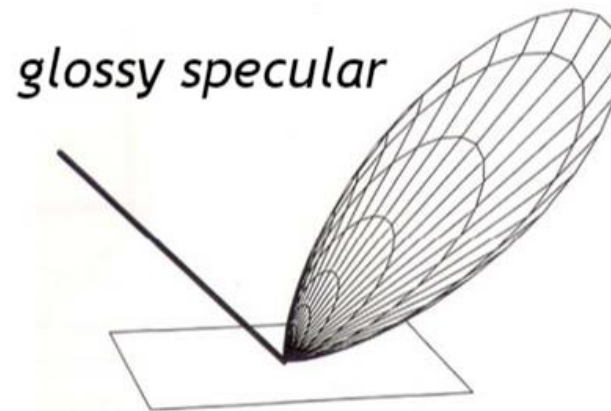

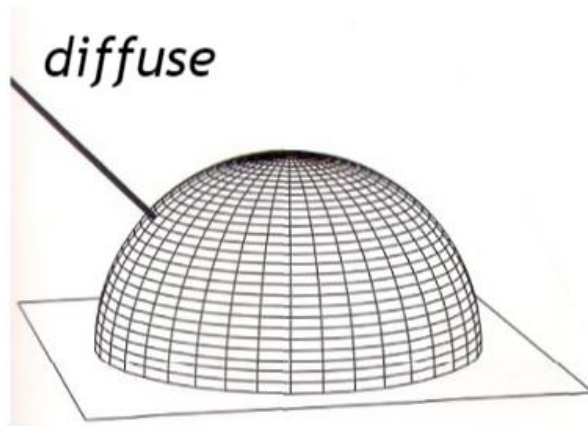

- Describe how much light (**ratio**) coming from  $\omega_i$  will reflect toward  $\omega_o$  at point  $x$

# Formal Material Representation (cont.)

$$f_r(x, \omega_o \leftarrow \omega_i)$$

Describe how much light (**ratio**) coming from  $\omega_i$  will reflect toward  $\omega_o$  at point  $x$

# Formal Material Representation (cont.)

- A good representation should have
  - Accuracy
  - Expressiveness
  - Speed

Error Image

Reference

Reconstructed

$$k_s \cdot I \cdot \max(0, vE \cdot vR)^n$$

 $n = 3.0$  $n = 5.0$  $n = 10.0$  $n = 27.0$  $n = 200.0$

# Classification of BRDF

- **Phenomenological models**

- Qualitative approach
- Models with intuitive parameters
- Examples are Phong and Blinn-Phong lighting models

- **Geometric optics**

- Microfacet models

- **Measured data**

- Usually described in tabular form or coefficients of a set of basis functions

# Outline

- Overview
- **Microfacet Models**
- Materials beyond BRDFs
- BRDFs for Production

# Microfacet Model

- Rough surfaces can be modeled as a collection of small **microfacets**
- The **aggregate behavior** of the small microfacets determines the scattering
- Two components for deriving a closed-form BRDF expression
  - The distribution of microfacets
  - How light scatters from the individual microfacet

## Microfacet Model (cont.)

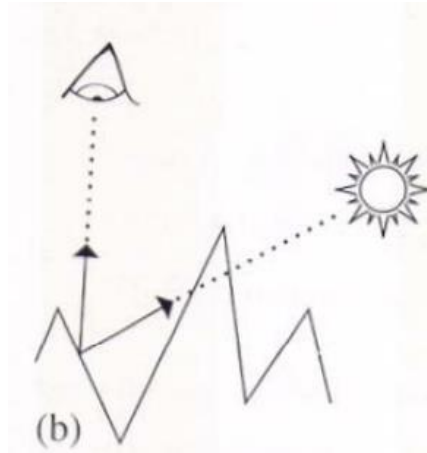

Most microfacet models assume that all microfacets make up **symmetric V-shaped** grooves so that only neighboring microfacet needs to be considered

# Microfacet Model (cont.)

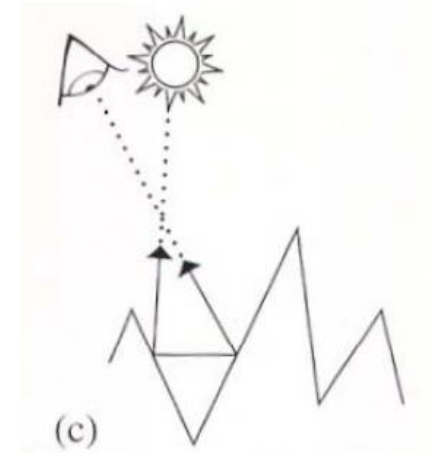

- Important geometric effects to consider

(a) **masking**

(b) **shadowing**

(c) **interreflection**

- Particular models consider these effects with varying degrees of accuracy

# Torrance-Sparrow Model

- One of the first microfacet model
- Designed to model **metallic** surfaces
- Assumption: a surface is composed of a collection of **perfectly smooth mirrored** microfacets with **distribution**  $D(\omega_h)$

# Torrance-Sparrow Model (cont.)

- Described by
  - Microfacet distribution  $D$
  - Geometric attenuation  $G$
  - Fresnel reflection  $F$

$$f_r(\omega_o \leftarrow \omega_i) = \frac{D(\omega_h)G(\omega_i, \omega_o)F(\omega_i, \omega_h)}{4\cos\theta_i\cos\theta_o}$$

# Torrance-Sparrow Model (cont.)

- Described by
  - Microfacet distribution  $D$
  - **Geometric attenuation  $G$**
  - Fresnel reflection  $F$

$$f_r(\omega_o \leftarrow \omega_i) = \frac{D(\omega_h) G(\omega_i, \omega_o) F(\omega_i, \omega_h)}{4 \cos \theta_i \cos \theta_o}$$

# Torrance-Sparrow Model (cont.)

- Geometry attenuation factor

**shadowing**

**masking**

$$G = \frac{\text{facet area that is both visible and illuminated}}{\text{total facet area}}$$

# Torrance-Sparrow Model (cont.)

- Configuration

# Torrance-Sparrow Model (cont.)

- Shadowing term

$$1 - \frac{m_s}{w}$$

$$a \sin \theta_i = w \cos \theta_h + m_s \cos \theta_h \quad \times \cos \theta_i$$

$$a \cos \theta_i = w \sin \theta_h - m_s \sin \theta_h \quad \times -\sin \theta_i$$

$$\frac{m_s}{w} = -\frac{\cos(\theta_h + \theta_i)}{\cos(\theta_h - \theta_i)}$$

$$1 - \frac{m_s}{w} = \frac{2\cos\theta_h \cos\theta_i}{\cos(\theta_h - \theta_i)}$$

# Torrance-Sparrow Model (cont.)

- Masking term

$$1 - \frac{m_v}{w}$$

$$\begin{aligned} a \sin \theta_o &= w \cos \theta_h + m_s \cos \theta_h \quad \times \cos \theta_o \\ a \cos \theta_o &= w \sin \theta_h + m_s \sin \theta_h \quad \times -\sin \theta_o \end{aligned}$$

$$1 - \frac{m_v}{w} = \frac{2 \cos \theta_h \cos \theta_o}{\cos(\theta_h - \theta_o)}$$

# Torrance-Sparrow Model (cont.)

- Geometry attenuation factor

$$G = \frac{\textit{facet area that is both visible and illuminated}}{\textit{total facet area}}$$

$$G = \min \left( 1 - \frac{m_s}{w}, 1 - \frac{m_v}{w} \right) = \min \left( \frac{2\cos\theta_h\cos\theta_i}{\cos(\theta_h - \theta_i)}, \frac{2\cos\theta_h\cos\theta_o}{\cos(\theta_h - \theta_o)} \right)$$

# Torrance-Sparrow Model (cont.)

- Described by
  - Microfacet distribution  $D$
  - Geometric attenuation  $G$
  - **Fresnel reflection  $F$**

$$f_r(\omega_o \leftarrow \omega_i) = \frac{D(\omega_h)G(\omega_i, \omega_o)F(\omega_i, \omega_h)}{4\cos\theta_i\cos\theta_o}$$

# Torrance-Sparrow Model (cont.)

- Real-world surface has both **reflection** and **transmission**
  - Perfect specular reflection:  $\theta_i = \theta_o$
  - Perfect specular transmission:  $\underline{\eta}_i \sin \theta_i = \underline{\eta}_t \sin \theta_t$  (Snell's law)  
index of refraction

perfect reflection

perfect transmission

# Torrance-Sparrow Model (cont.)

- **Reflectivity** and **transmissiveness**: fraction of incoming light that is reflected or transmitted
  - Usually **view dependent**
  - Hence, the reflectivity is not a constant and should be corrected by the **Fresnel equation**
- Fresnel equation
  - Related to the wave's electric field
  - S polarization and P polarization

[https://en.wikipedia.org/wiki/Fresnel\\_equations](https://en.wikipedia.org/wiki/Fresnel_equations)

# Torrance-Sparrow Model (cont.)

- Different properties for dielectrics and conductors

$$r_{\parallel} = \frac{\eta_t \cos \theta_i - \eta_i \cos \theta_t}{\eta_t \cos \theta_i + \eta_i \cos \theta_t}$$

$$r_{\perp} = \frac{\eta_i \cos \theta_i - \eta_t \cos \theta_t}{\eta_i \cos \theta_i + \eta_t \cos \theta_t}$$

Fresnel reflectance  
for **dielectrics**

$$r_{\parallel}^2 = \frac{(\eta^2 + k^2) \cos^2 \theta_i - 2\eta \cos \theta_i + 1}{(\eta^2 + k^2) \cos^2 \theta_i + 2\eta \cos \theta_i + 1}$$

$$r_{\perp}^2 = \frac{(\eta^2 + k^2) - 2\eta \cos \theta_i + \cos^2 \theta_i}{(\eta^2 + k^2) + 2\eta \cos \theta_i + \cos^2 \theta_i}$$

Fresnel reflectance  
for **conductors**

$$F_r(\omega_i) = \frac{1}{2} (r_{\parallel}^2 + r_{\perp}^2)$$

assume light is unpolarized

# Torrance-Sparrow Model (cont.)

- Indices of refraction

medium	Index of refraction
Vaccum	1.0
Air at sea level	1.00029
Ice	1.31
Water (20°C)	1.333
Fused quartz	1.46
Glass	1.5~1.6
Sapphire	1.77
Diamond	2.42

# Torrance-Sparrow Model (cont.)

perfect specular refraction

# Torrance-Sparrow Model (cont.)

perfect specular transmission (refraction)

# Torrance-Sparrow Model (cont.)

Fresnel modulation

# Torrance-Sparrow Model (cont.)

- Described by
  - **Microfacet distribution  $D$**
  - Geometric attenuation  $G$
  - Fresnel reflection  $F$

$$f_r(\omega_o \leftarrow \omega_i) = \frac{D(\omega_h)G(\omega_i, \omega_o)F(\omega_i, \omega_h)}{4\cos\theta_i\cos\theta_o}$$

**How many micro surfaces have this orientation**

Commonly used distributions: Beckmann, GGX

$$D(\omega_h) = \frac{\alpha^2}{\pi((\mathbf{n} \cdot \omega_h)^2 (\alpha^2 - 1) + 1)^2}$$

# Torrance-Sparrow Model (cont.)

- Put it all together

measured

Blinn-Phong

Cook-Torrance  
(microfacet)

# Oren-Nayar Model

- Many real-world materials such as concrete, sand and cloth are not real Lambertian
  - Specifically, rough surfaces generally appear brighter as the illumination direction approaches the viewing direction

Lambertian model

real image

- Assumption: a surface is composed of a collection of **perfectly Lambertian** grooves whose orientation angles follow a Gaussian distribution

# Oren-Nayar Model (cont.)

$$f_r(\omega_o \leftarrow \omega_i) = \frac{\rho}{\pi} (A + B \max(0, \cos(\phi_i - \phi_o))) \sin \alpha \tan \beta$$

$$A = 1 - \frac{\sigma^2}{2(\sigma^2 + 0.33)} \quad \sigma^2 \text{ the standard deviation of Gaussian}$$

$$B = \frac{0.45\sigma^2}{\sigma^2 + 0.09}$$

$$\alpha = \max(\theta_i, \theta_o)$$

$$\beta = \min(\theta_i, \theta_o)$$

# Oren-Nayar Model (cont.)

Lambertian model

# Oren-Nayar Model (cont.)

Oren-Nayar model

# Oren-Nayar Model (cont.)

- When the standard deviation  $\sigma$  becomes zero, Oren-Nayar model is reduced to Lambertian model

$$f_r(\omega_o \leftarrow \omega_i) = \frac{\rho}{\pi} (A + B \max(0, \cos(\phi_i - \phi_o)) \sin \alpha \tan \beta)$$

$$\rightarrow f_r(\omega_o \leftarrow \omega_i) = \frac{\rho}{\pi}$$

$\sigma = 0$

$\sigma = 0.1$

$\sigma = 0.3$

- BRDFs for Production

# Subsurface Scattering

- Some materials interact with lights with a subsurface scattering process that **allows lights to enter and scatter within a medium**
- It gives objects a distinct soft look

# BSSRDF

- BRDF v.s. BSSRDF

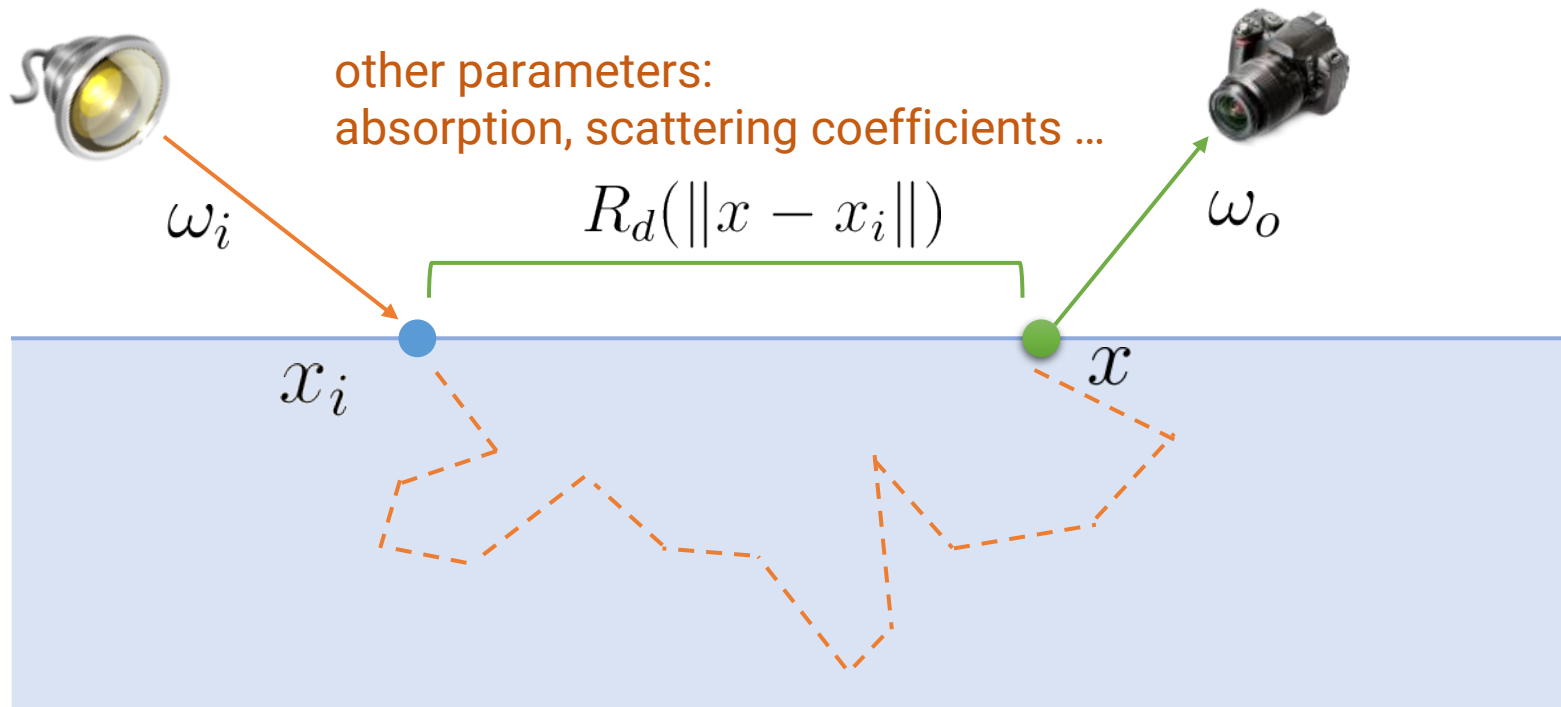

Bidirectional Reflectance  
Distribution Function  
(BRDF)

Bidirectional Subsurface  
Scattering Reflectance  
Distribution Function  
(BSSRDF)

# Approximate BSSRDF with Dipole

$$S(x, \omega_o; x_i, \omega_i) = S^1(x, \omega_o; x_i, \omega_i) + S^d(x, \omega_o; x_i, \omega_i)$$

$$S^d(x, \omega_o; x_i, \omega_i) = \frac{1}{\pi} F_t(\eta, \omega_o) R_d(\|x - x_i\|) F_t(\eta, \omega_i)$$

“A Practical Model for Subsurface Light Transport”, Jensen et al. 2001

# Outline

- Overview
- Microfacet Models
- Materials beyond BRDFs
- **BRDFs for Production**

# Disney Principled BRDF

- **Phenomenological models**
  - More intuitive parameters; however, not accurate
- **Geometric optics**
  - More accurate but difficult to use by artists
- **Disney Principled BRDF** would like to combine the advantages of both models!
  - Represent a physically-based model (based on the Microfacet model) with few intuitive parameters
  - Each parameter has a range between [0, 1]
  - <https://disneyanimation.com/publications/physically-based-shading-at-disney/>

# Disney Principled BRDF (cont.)

- Proposed when producing the movie, **Wreck-It Ralph** (2012)
  - Also used by the **Unity** and **Unreal** engine

# Disney Principled BRDF (cont.)

# Disney Principled BRDF (cont.)
