Shading: Materials and Lighting

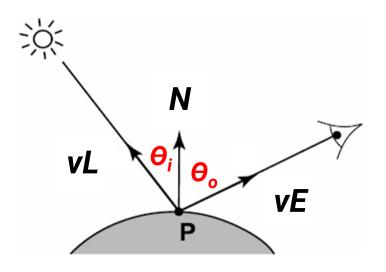

Shading: Materials and Lighting (cont.)

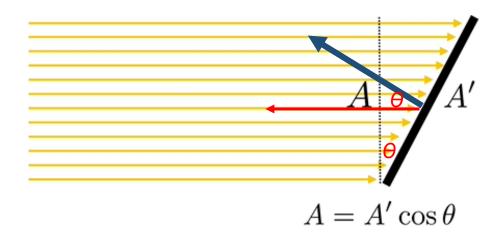

Shading

- Shading refers to the process of altering the color of an object/surface/polygon in the 3D scene
- In physically-based rendering, shading tries to approximate the local behavior of lights on the object's surface, based on things like
 - Surface orientation (normal) N
 - Lighting direction vL (and Θ_i)
 - Viewing direction vE (and Θ_o)
 - Material properties
 - Participating media
 - etc.

Lambertian Cosine Law

- Illumination on an oblique surface is less than on a normal one
- Generally, illumination falls off as cosθ

$$E = \frac{\Phi}{A'} = \frac{\Phi \cos \theta}{A}$$

Lights in Computer Graphics

```
Point light
Spot light
Area light
```

Directional lightEnvironment lightdistant lights

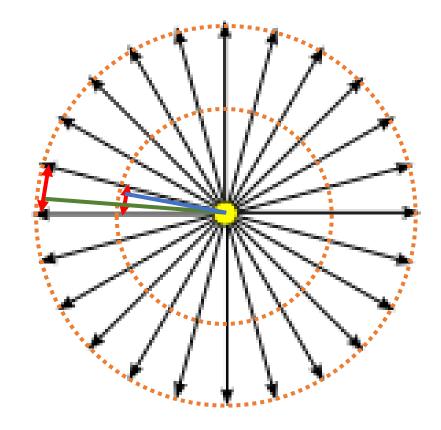

Local Light

- The distance between a light and a surface is NOT long enough compared to the scene scale
- The position of light needs to be considered during shading
 - Lighting direction vL = |P_L P|
 - Lighting attenuation is proportional to the square of the distance between the light and the point

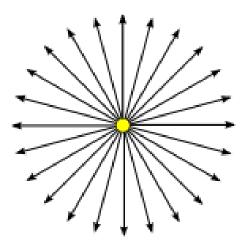

Local Light Attenuation

- The length of the side of a receiver patch is proportional to its distance from the light
- As a result, the average energy per unit area is proportional to the square of the distance from the light

Point Light

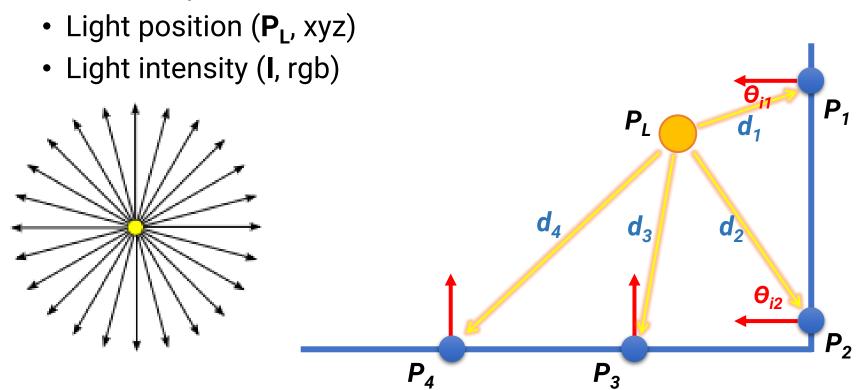

A scene illuminated by a point light

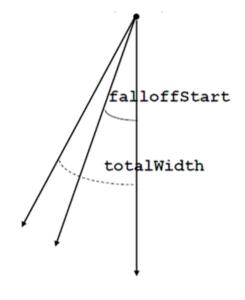

Point Light (cont.)

- An isotropic point light source that emits the same amount of light in all directions
- Described by

Spot Light

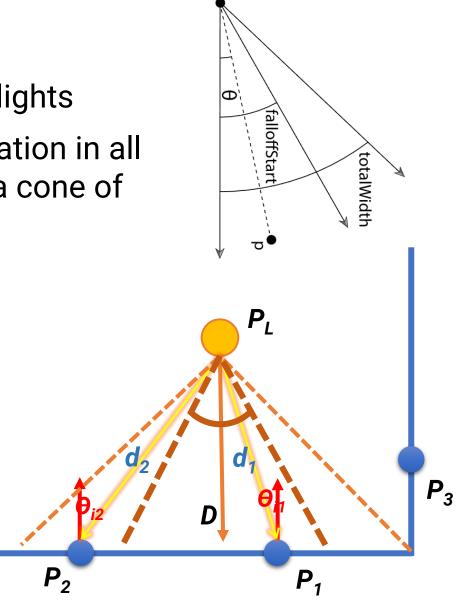

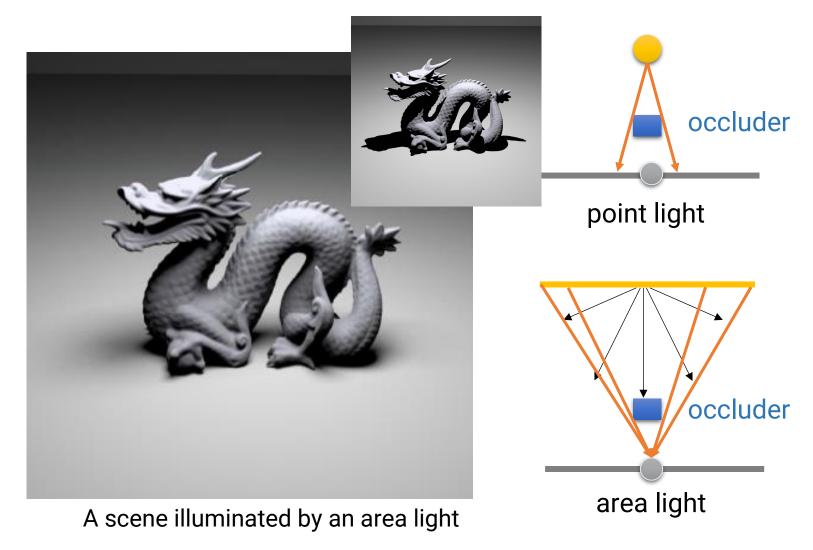

A scene illuminated by a spot light

Spot Light (cont.)

- A handy variation on point lights
- Rather than shining illumination in all directions, it emits light in a cone of directions from its position
- Described by
 - Light position (P_L, xyz)
 - Light intensity (I, rgb)
 - Light direction (D, xyz)
 - TotalWidth
 - FalloffStart

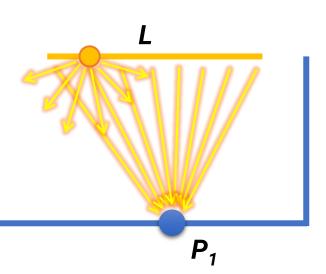

Area Light

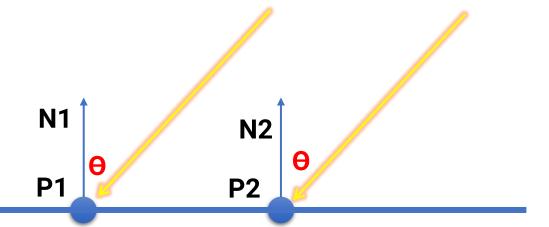

Area Light (cont.)

- Defined by one or more shapes that emit light from their surface, with some directional distribution of energy at each point on the surface
- Require integration of lighting contribution across the light surface
 - In offline rendering, usually estimated by sampling
 - Expensive for real-time rendering
 - Heitz et al., SIGGRAPH 2016
 - Dupuy et al., SIGGRAPH 2017

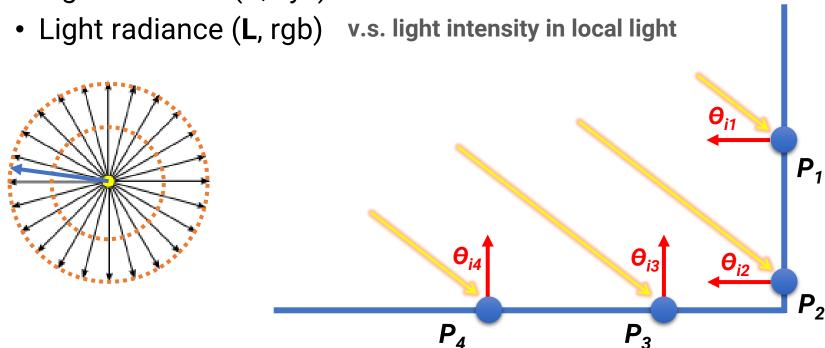

Distant Light

- The distance between a light and a surface is long enough compared to the scene scale and can be ignored
 - Lighting direction is fixed
 - No lighting attenuation
- Directional light (sun) is the most common distant light

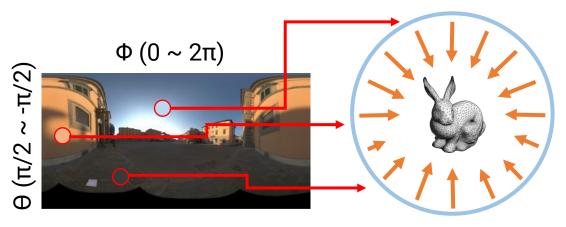

Directional Light

- Describes an emitter that deposits illumination from the same direction at every point in space
- Described by
 - Light direction (D, xyz)

Environment Light

- Use a texture (cube map or longitude-latitude image) to represent a spherical energy distribution
 - Each texel maps to a spherical direction, considered as a directional light
 - The whole map illuminates the scene from a virtual sphere at an infinite distance
- Also called image-based lighting (IBL)

Environment Light (cont.)

· Widely used in digital visual effects and film production

Environment Light (cont.)

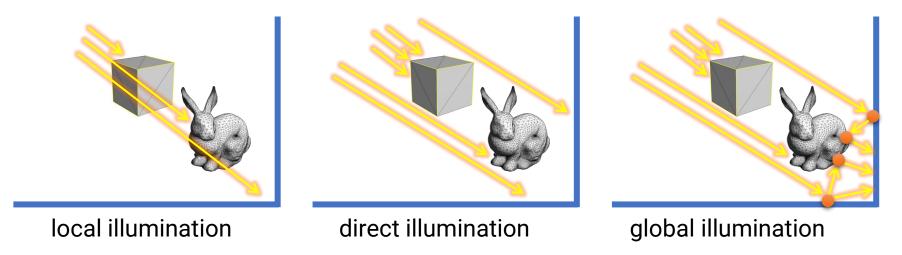

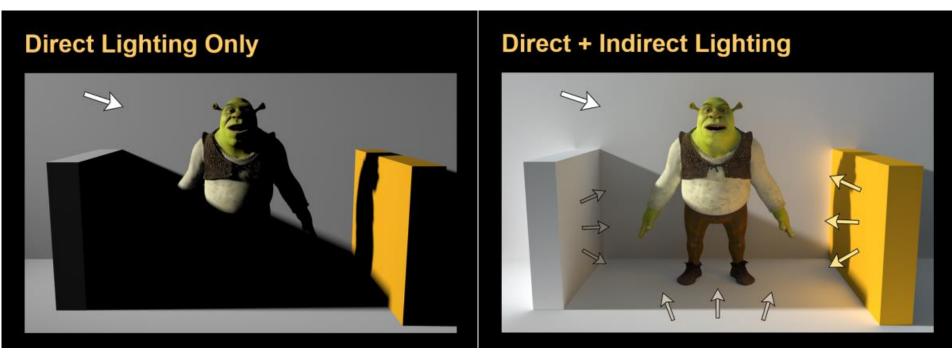

Local, Direct, and Global Illumination

- Direct illumination considers only the direct contribution of lights
- Local illumination can be considered as direct lighting without occlusion (all lights are fully visible, no shadows)
- Global illumination includes multi-bounce illumination reflected from other surfaces (need recursive computation!)

Local, Direct, and Global Illumination (cont.)

Comparison of direct and global illumination

Outline

- Overview
- Lights
- Materials
- Material file format
- OpenGL implementation

Materials

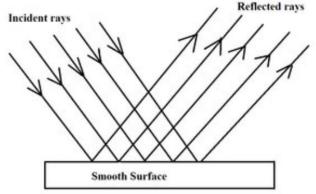

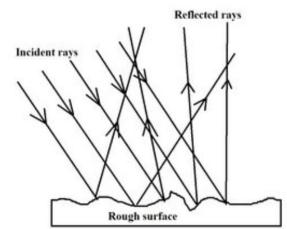

Materials (cont.)

- Highly related to surface types
- The smoother a surface, the more reflected light is concentrated in the direction a perfect mirror would reflect the light

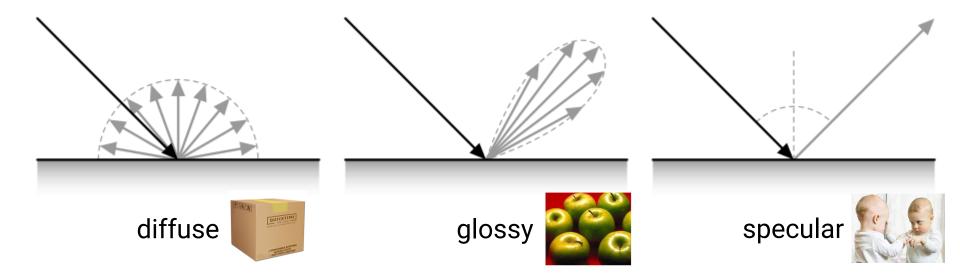

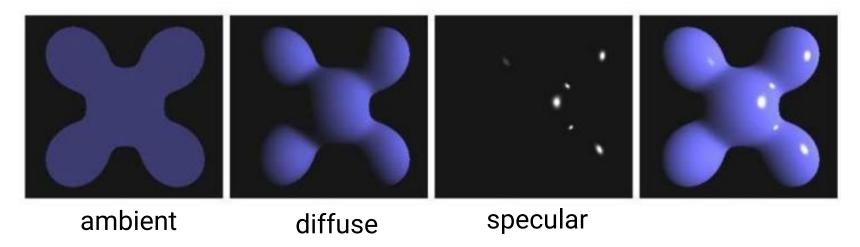

Materials (cont.)

- Highly related to surface types
- The smoother a surface, the more reflected light is concentrated in the direction a perfect mirror would reflect the light

Phong Lighting Model

- Diffuse reflection
 - Light goes everywhere; colored by object color
- Specular reflection
 - Happens only near mirror configuration; usually white
- Ambient reflection
 - Constant accounted for global illumination (cheap hack)

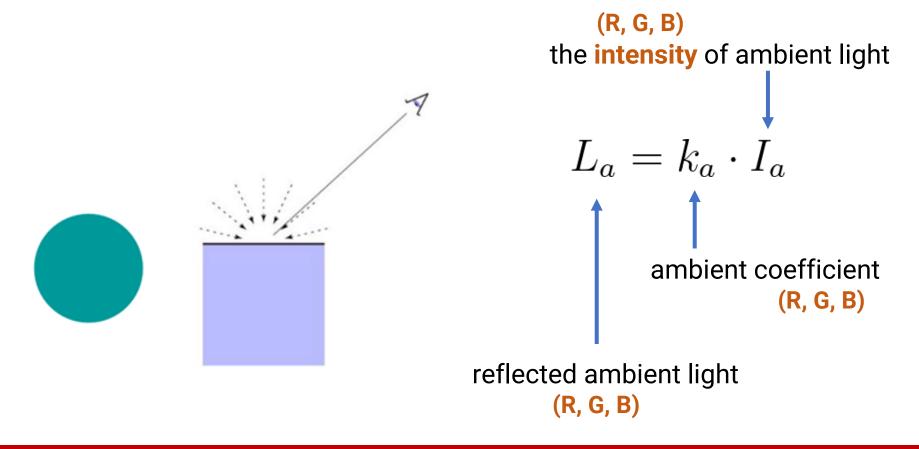

Ambient Shading

 Add constant color to account for disregarded illumination and fill black shadows

Ambient Shading (cont.)

 Add constant color to account for disregarded illumination and fill black shadows

Diffuse Shading

- Assume light reflects equally in all directions
 - The surface is rough with lots of tiny microfacets

Therefore, the surface looks the same color from all views (view independent)

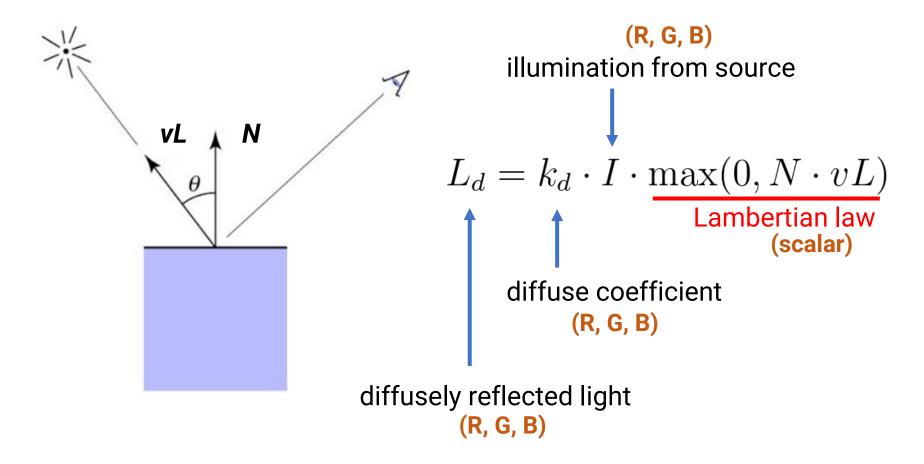

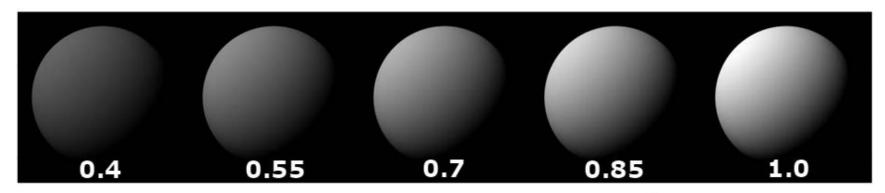

- Assume light reflects equally in all directions
 - The surface is rough with lots of tiny microfacets
- Therefore, the surface looks the same color from all views (view independent)

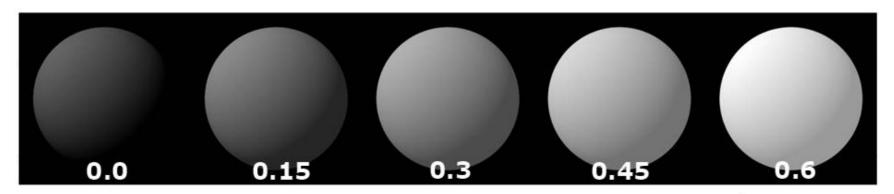

Applies to diffuse or matte surface

diffuse-reflection model with different $\,k_{
m d}$

ambient and diffuse-reflection model with different $k_{\scriptscriptstyle a}$

$$I_a = 1.0$$
 $k_d = 0.4$

- For color objects, apply the formula for each color channel separately
- Light can also be non-white

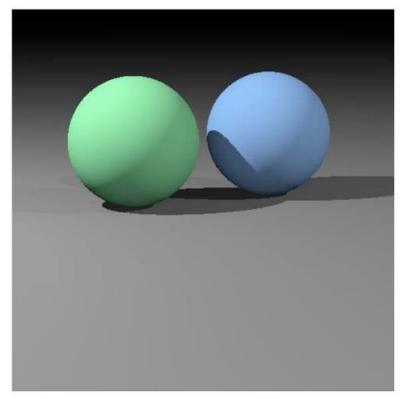

Example:

white light: (0.9, 0.9, 0.9) yellow light: (0.8, 0.8, 0.2)

$$L_d = k_d \cdot I \cdot \max(0, N \cdot vL)$$

Example:

green ball: (0.2, 0.7, 0.2) blue ball: (0.2, 0.2, 0.7)

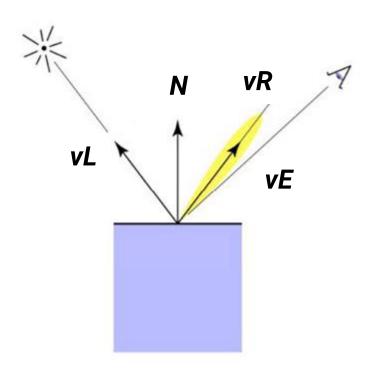

Specular Shading

- Some surfaces have highlights, mirror-like reflection
- View direction dependent
- Especially obvious for smooth shiny surfaces

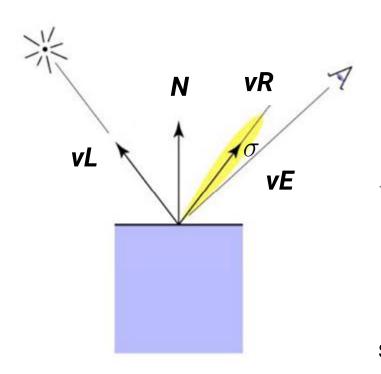

Phong specular model [1975]

$$\begin{aligned} vR &= vL + 2((N \cdot vL)N - vL) \\ & \uparrow = 2(N \cdot vL)N - vL \\ & \text{perfectly reflected direction} \end{aligned}$$

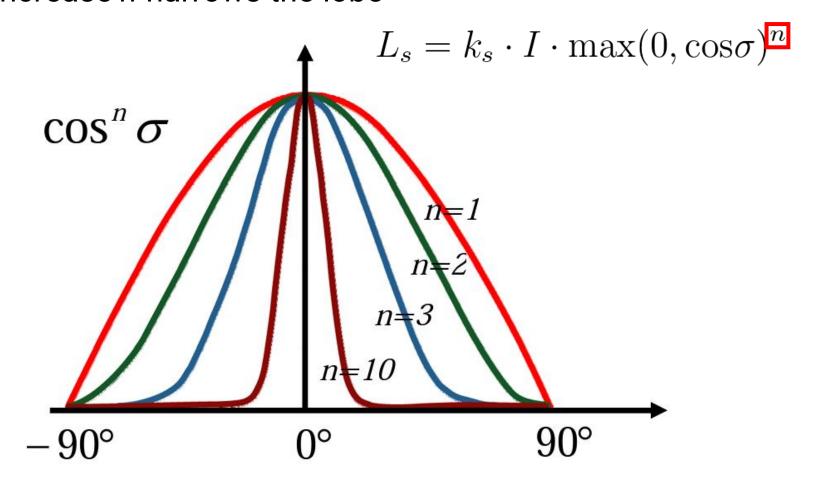

(you can find the proof here)

- Phong specular model [1975]
 - Fall off gradually from the perfect reflection direction

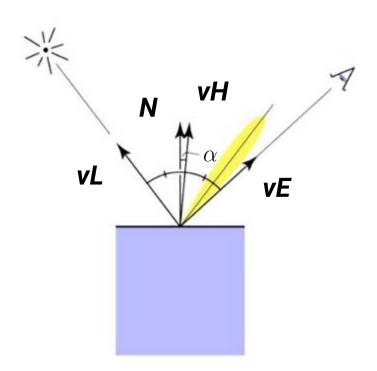

$$vR = vL + 2((N \cdot vL)N - vL)$$
 $= 2(N \cdot vL)N - vL$
(scalar)
(R, G, B) specular exponent
$$L_s = k_s \cdot I \cdot \max(0, \cos\sigma)^n$$
 $= k_s \cdot I \cdot \max(0, vE \cdot vR)^n$
specular coefficient (R, G, B)
specularly reflected light (R, G, B)

Increase n narrows the lobe

Phong specular Variant: Blinn-Phong

- Rather than computing reflection directly, just compare to normal bisection property
- One can prove $\cos^n(\sigma) = \cos^{4n}(\alpha)$

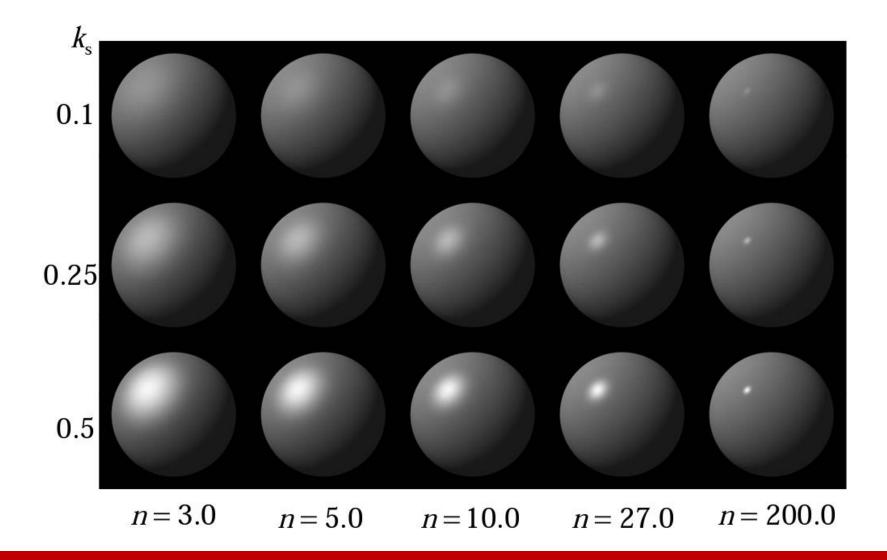

half vector

$$vH = bisector(vL, vE)$$

$$= \frac{(vL + vE)}{\|vL + vE\|}$$

$$L_s = k_s \cdot I \cdot \max(0, \cos \alpha)^n$$

= $k_s \cdot I \cdot \max(0, N \cdot vH)^n$

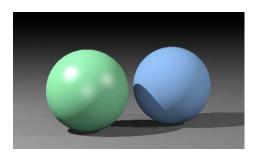

Complete Phong Lighting Model

 Compute the contribution from a light to a point by including ambient, diffuse, and specular components

$$L = L_a + L_d + L_s$$

= $k_a \cdot I_a + I(k_d \cdot \max(0, N \cdot vL) + k_s \cdot \max(0, N \cdot vH)^n)$

 If there are s lights, just sum over all the lights because the lighting is linear

$$L = k_a \cdot I_a + \sum_{i} (I_i(k_d \cdot \max(0, N \cdot vL_i) + k_s \cdot \max(0, N \cdot vH_i)^n))$$

Some Results with Phong Lighting Model

Material Template Library (cont.)

- The material template library (*.mtl) used by a Wavefront OBJ (*.obj) file describes material properties using
 - Phong lighting model (Ka, Kd, Ks, Ns)
 - Texture maps (mapKa, mapKd, mapKs, mapNs ...)
 - Transparency (d, Tr, Ni)
 - ... etc.
- You can refer to the wiki page for more information https://en.wikipedia.org/wiki/Wavefront_.obj_file
